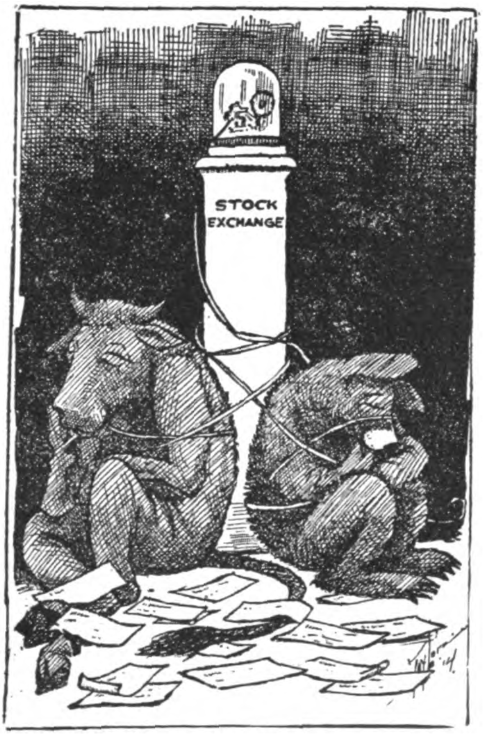
"The financing alone of our railroads promises to call for very considerable sums. The long expected decision of the Interstate Commerce Commission was published on August 1st, but owing to the seething condition of the markets at that time it was practically lost sight of by others than those immediately affected. The decision was considered of so little help, and the war produced so many further complications, that on September 9th, a committee of the Eastern Railroads called on President Wilson and laid before him their plea that unless rates were increased they saw themselves unable to finance even the most pressing needs of their roads. As this would have had the ultimate result of lengthening the list of railroads in the hands of receivers, Mr. Wilson let it be known that he appreciated the plight of the railroads, and it is no doubt due largely to this that the Interstate Commerce Commission has signified its intention to reopen the case on October 19th. It is also intended that the view point of the investor shall be considered this time—and by the investor we mean not only the one share man, but large financial institutions, savings banks, life insurance companies, etc., who are directly interested in railroad securities. If the investor's side, as well as the railroad's side of the case convinces the Interstate Commerce Commission that rates should be increased, then of this war, which has brought the situation to a head, it may be said that the ill wind it is so generally sowing has at least blown good to one of the most important industries of the country, as well as to a very large portion of our people."

Speaking of general business conditions, the monthly statement issued October 1st by the National City Bank of New York, asserts that:

"Banking conditions have improved during the month, confidence being greatly strengthened. The tension in the money market has eased. There have been comparatively few insolvencies of importance in trade, and the banks generally have been caring for the necessities of their customers with praiseworthy consideration.

"The bank clearings tell a story of diminishing exchanges. Those for New York City are, of course, affected by the closing of the Stock Exchange, although trading on the exchange was very light a year ago, but for the country outside of New York they are running about ten per cent below the same weeks last year. Railway traffic earnings are lower, although roads in the wheat territory make a good showing. The middle west is in excellent condition because of the high price farm products are commanding and its buying powers are certain to be a great supporting factor in the situation for the year to come. The South has a big cotton crop, which turns out to be rather a dubious blessing, but while the price is sure to be disappointing as compared with expectations a little more than



HIBERNATING

—From Los Angeles Times.

two months ago, it will surely pay a great many debts and buy a great many goods.

"Industry has not recovered from the first shock caused by the declaration of war and the effect upon banking conditions. Commercial paper became unsaleable, the houses relying upon it were obliged to curtail their operations, everything in the line of new constructive work that could be held up was suspended, and the same is true of machinery and plant equipment purchases. Buying of all kinds has been curtailed as much as possible. The result naturally has been a considerable curtailment of employment. The iron and steel industry is working at about 60 per cent of capacity. New foreign business so far has not made good losses at home. Operations in the oil fields have been restricted. The copper mines are working on about one-half time, but other mining operations have not been very seriously affected. The woolen industry, which was depressed because of tariff reductions, has improved, war conditions having interfered with foreign competition. Full employment for the woolen and worsted mills is in prospect. New England cotton mills are running light on account of the unsettled cotton situation. Buyers of goods are holding off and mill operators are doing the same, waiting more definite knowledge as to what the price of cotton will be. Manufacturers claim that cotton goods are now below a ten cent price for cotton. Wool is affected by the same conditions that affect cotton, but not so seriously.

"The hosiery trade has not been good. In the past this country has exported certain lines of hosiery, silk almost exclusively, to England, Germany, Austria, France, Italy, South Africa and Australia, but this business is now practically cut off. The total consumption of hosiery in the United States amounts to about $80,000,000 to $90,000,000 and of this an average of from $4,000,000 to $5,000,000 has been imported. The manufacturers have looked forward to a notable increase in imports because of the low tariff, but this is being prevented by the war conditions.

"During the last half of September, buyers appeared in this market for European governments with large orders for army supplies and some important contracts have been made. The Italian government is authoritatively reported to be ready to expend $5,000,000 for shoes, knapsacks, saddles and clothing equipment. Heavy orders from other governments have also been taken for underwear, towels, army duck, blankets, etc. These are helping out the situation in spots materially, and giving a better tone all around. The market has been swept practically bare of these goods suitable for army use.

"The situation as regards new foreign trade develops very slowly. Important credits for the South American countries have been granted in New York, and some trade has been created in this manner. The growth of business with South America necessarily will be slow, because of the absolute shutting off of the supply of capital from European sources."

Referring particularly to the railway situation, Hambleton and Company of Baltimore, has the following to say in its financial circular of October 9th:

"Novel methods have been taken by the Government and by individuals to protect conditions brought about by the war, due to the fact that no adequate laws or machinery of law exists to remedy the peculiar circumstances. On the other hand, in the face of continually diminishing net earning reports of the railroads throughout the South and East, the Interstate Commerce Commission, which has the right and power to act immediately to relieve the situation, has not yet shown a sympathetic disposition to co-operate with our greatest industry, to protect its business or to conserve the value of its securities. The demand for capital during or after the war, (and the longer the war lasts the greater the demand will be), it is anticipated will be insistent and lenders will naturally obtain a return on their investments commensurate with the demand. A promise to pay, unsupported by demonstrated ability to pay, cannot compete with a security whose equity and earnings are proven. Our railroad issues hold an enviable position both here and abroad, but as earnings become impaired their attractiveness will be lessened. This is axiomatic, and the artificial restraints to trading will only postpone the day of declining values, unless the Interstate Commerce Commission grant, in the interim, an increase in freight rates sufficient to enable the roads to show an ability to earn, and pay a competitive return to their security holders. Unless such action is taken not only the stockholders will suffer, but the query at once becomes pertinent—How are the railroads to finance either their maturities or the necessary requirements for maintenance, betterments or additions? The question is a national one and public opinion, we believe, is in favor of granting the roads immediate and substantial relief."

The Widespread Effect of the War.

EACH section of the United States is at present suffering, to a greater or less extent, from the effects of the European war. As time progresses, these effects are likely to prove somewhat stimulating in the Western sections of the country, but will probably continue to exert a depressing effect in other sections.

The East, at the present time, is not only suffering from an extreme depression of finance but also from an interference with its manufacturing industries and foreign trade, the latter, however, has shown some signs of improvement recently and is expected to bring with it a consequent improvement in the former. There must, however, be a radical readjustment in manufacturing activities before any great or permanent improvement can be established.

The effect of the war in the South is also indissolubly associated with the dependence of the Southern people upon the cotton industry. The recent decreases in price, being unaccompanied as they were, by any reduction in the cost of production, have temporarily, at least, meant a great loss to the people of that section which, it is hoped, however, may be reasonably offset by future developments. While the loss is of course greatest in Texas, all other Southern States have been more or less affected.

The West is apparently the only section of the country which has yet to record any possible financial benefits from the war. Largely through its influence, it is estimated that the corn crop has increased in value about $350,000,000 and the wheat crop by approximately $300,000,000, to which may be added $200,000,000 for the appreciation of other grain crops. This should logically mean more business for the grain elevators, the flour mills, the dealers and the exporters. In fact, its effect should be felt even among dealers in general merchandise and, in this way, may extend well into the Eastern section of the country.

Discussing the general effect of the war upon the whole country, *Moody's Magazine* for October first has the following to say:

"As to the net effect of the war upon the business of the entire population of the United States, only the roughest estimates can be formed. These must be obtained from a study of the decrease in bank exchanges, since any study of the price movements of commodities and merchandise is so complicated and involved as to lead nowhere. So far as can be judged from the inadequate data the net personal earnings of the population of New York City are equivalent to something like three per cent of the yearly bank exchanges of the city. Out side of New York these net earnings seem to be equivalent to about 31 per cent of exchanges. The relation between net incomes and bank exchanges is loose and undependable, but it is the only guide we have.

"Upon this basis the fact that bank exchanges are running 41 per cent behind last year in New York and about 7.3 per cent behind outside of New York would indicate a loss of something like $2,800,000,000 annually in the net personal earnings of the entire population of this country. Meantime the total of such earnings when normal has been estimated at about $26,000,000,000. Here is a loss at the rate of more than 10 per cent indicated by the conditions prevailing at the end of September; but when the exchanges reopen and foreign commerce largely resumes, this rate of loss will doubtless be cut away down. Still the prospect that the United States will make a net profit out of the war may even now be said to have definitely disappeared."

Southern Development.

REPORTS of the railroads of the United States to the Interstate Commerce Commission for the year ended June 30, 1914, throw an interesting light on the development of the South during the year as compared with other parts of the country.

One of the best measures of the progress of a community is afforded by the gross operating revenues of its railroads. Measured by this standard, it will be seen that the South is the only section of the country that did a larger business during the fiscal year than in the last preceding twelve months.

In the Eastern District, north of the Ohio and Potomac Rivers and east of a line running from Chicago to St. Louis, thence down the Mississippi to the mouth of the Ohio, gross operating revenues for the year show a decrease of $960 per mile or 4.1 per cent. In the Western District, embracing all of the country west of the Chicago-St. Louis line and west of the Mississippi River, there was a decrease of $440 per mile or 4.3 per cent. In the Southern District, embracing the territory south of the Ohio and Potomac Rivers and east of the Mississippi River, there was an increase of $215 per mile or two per cent.

These figures show that the falling off in business in all other parts of the United States during the fiscal year did not limit Southern development as a whole but that, while some lines of business may have been affected by the falling oft in demand in other parts of the country, there was a substantial growth in the business of the South as a whole.

An interesting fact brought out by the reports to the Interstate Commerce Commission is that the railroads of the South did not share in full measure in the prosperity of the section. While their gross operating revenues increased at the rate of $215 per mile, the increase in operating expenses and taxes was so great as not only to absorb the total increase in gross operating revenues but to make an actual reduction in operating income of $85 per mile or 3.2 per cent.

Railway Financial Results for July as Reported by the Bureau of Railway Economics.

THE report of the Bureau of Railway Economics at Washington, on the revenues and expenses of steam roads in the United States during the month of July, shows in brief, that railway operating income for the month, reduced to a per mile of line basis, and compared with that for July, 1913, registered a decrease of $9.00, or 3.1 per cent, as compared with similar results for July, 1913, while total operating revenue per mile for July of the current year, decreased 5 per cent as compared with the same month of 1913. Operating expenses per mile also decreased 6.2 per cent, while net operating revenue per mile decreased 2.1 per cent. The total operating revenue for the month amoutned to $256,404,337. This amount includes revenues from freight and passenger traffic, from carrying mail and express, and from miscellaneous sources connected with rail and auxiliary operations. Compared with July, 1913, these operating revenues show a decrease of $10,476,467. Total operating revenues per mile averaged $1,124 in July, 1914, and $1,183 in July, 1913, a decrease of $59, or 5.0 per cent.

Operating expenses, which include all the costs of maintaining track and equipment, operating trains, securing traffic, and of administration, amounted to $178,988,195. This was $9,645,172 less than for July, 1913. These operating expenses per mile of line averaged $785 in July, 1914, and $836 in July, 1913, a decrease of $52 per mile, or 6.2 per cent.

Net operating revenue, that is, total operating revenues of rail and auxiliary operations less operating expenses, amounted to $77,416,142, which was $831,295 less than for July, 1913. Net operating revenue per mile of line averaged $339 in July, 1914, and $346 in July, 1913, a decrease of $7 per mile, or 2.1 per cent.

Taxes for the month of July amounted to $11,387,392, or $50 per mile, an increase of 3.8 per cent over July, 1913.

Operating income, which is net revenue from rail and auxiliary operations, less taxes, averaged $289 per mile of line, and in July, 1913, $298, thus decreasing $9, or 3.1 per cent. Operating income for each mile of line for each day in July averaged 9.33 and in July, 1913, $9.63.

Operating income is that proportion of their operating receipts which remains available to the railways for rentals, interest on bonds, appropriations for betterments, improvements, new construction, and for dividends.

Railway Net Earnings for August.

DURING August, according to the latest figures published by the *Commercial and Financial Chronicle*, the gross receipts of American railways were $87,772,384, as against $87,300,840 for the corresponding month in 1913. This result was obtained in spite of the fact of over an $11,000,000 decrease in gross. While these results show that the efforts of extreme economy were successful in overcoming the shrinkage in gross revenues, they are of course extremely unsatisfactory in view of the fact that a considerable improvement in net earnings is required each year in order that the railways shall merely hold their own. Another fact to be borne in mind is that the comparison is with unusually poor returns for the corresponding month of last year, as that month showed a shrinkage of over $9,000,000 as compared with August of 1912. The following compilation prepared by the *Chronicle* gives the net earnings for August for a series of years:

	Net Earnings.		
Year. August.	Year Given.	Year Preceding.	Inc. (+) or Dec. (—)
1896	$17,418,959	$19,023,398	—$1,604,439
1897	24,228,620	19,592,169	+4,636,451
1898	27,942,601	28,189,822	—247,221
1899	29,730,968	25,200,009	+4,530,959
1900	33,216,118	31,032,360	+2,183,758
1901	40,548,771	34,210,061	+6,338,710
1902	35,928,409	37,776,146	—1,847,737
1903	41,282,319	35,747,474	+5,534,845
1904	43,168,250	40,913,469	+2,254,781
1905	43,201,744	40,480,712	+2,721,032
1906	48,074,911	42,719,768	+5,355,143
1907	45,629,104	44,849,985	+799,119
1908	75,028,707	84,251,096	—9,222,389
1909	90,384,539	75,319,538	+15,065,001
1910	89,517,074	90,176,937	—659,863
1911	86,224,971	86,820,040	—595,069
1912	99,143,971	87,718,505	+11,425,466
1913	83,143,024	92,249,194	—9,106,170
1914	87,772,384	87,300,840	+471,544

In discussing the results for separate roads, the *Chronicle* has the following to say:

"In the gross the losses decidedly predominate, though there are a few roads distinguished for gains. In the net, increases and decreases are pretty nearly evenly balanced. It deserves to be noted that the fact that the saving in expenses in the general totals overtops the loss in gross is due mainly to the rigid cutting down of expenses by a few prominent companies. Thus the Pennsylvania Railroad, through a paring down of the expense account, has converted a loss of $1,294,706 in gross into a gain of $399,020 in net, and the New York Central has changed a loss of $854,437 in gross into $230,648 gain in net. This last is for the Central proper. Including the various auxiliary and controlled roads, the whole going to form the New York Central *System*, the result is yet more striking, the loss in the gross in that way reaching $2,063,363, with $1,094,758 gain in net.

"Some of the Western systems have distinguished themselves in much the same way. Thus the Great Northern Railway, with $197,413 loss in gross, has $702,895 gain in net. The Southern Pacific, with $560,999 loss in gross, has $532,318 loss in net. The Atchison is able to show $669,366 gain in gross and has succeeded in carrying forward $632,408 of this to the net. The Union Pacific, while having added only $26,526 to gross, has increased this to $189,656 in the net through reduced expenses. The

Milwaukee and St. Paul, with $116,565 increase in gross, has $295,035 increase in net. The St. Paul and Omaha, with $154,101 gain in gross, has $229,751 gain in net. The Illinois Central, with $148,229 gain in gross, has $284,348 gain in net.

"On the other hand, there are quite a number of instances where the results as to net are more unfavorable than those as to the gross, and still a few other cases where a large loss in gross has been attended by a considerable paring down of expenses, but not sufficient to wipe out entirely the shrinkage in the gross. The Baltimore and Ohio is of this latter type, it reporting $921,106 decrease in gross, but only $232,275 decrease in net. Among the New England roads, the Boston and Maine has $271,997 decrease in gross, with $324,332 decrease in net, and the New York, New Haven and Hartford $411,378 decrease in gross with $242,927 decrease in net. In the South the Southern Railway furnishes an instance of decreased gross attended by increased expenses; it reports $69,137 decrease in gross with $280,573 decrease in net. The Northern Pacific has $145,548 loss in gross but only $30,290 loss in net; the St. Louis and San Francisco has $358,314 loss in gross and only $154,068 loss in net, and the Missouri Pacific has turned $160,561 loss in gross into $71,252 gain in net. The Rock Island, like the Atchison, has a gain in both gross and net—$287,259 in the former and $142,693 in the latter. In the following we show all changes for the separate roads for amounts in excess of $100,000, whether increases or decreases, and in both gross and net."

Railway Gross Earnings for September.

ACCORDING to the latest statistical compilations of the *Commercial and Financial Chronicle*, gross earnings of United States railroads are falling off in all directions. The situation was bad enough before the outbreak of the war but since then has developed in one of unparalleled seriousness. Even a larger grain movement has failed to prevent a loss in the case of the Western roads, while a large shrinkage in the cotton traffic only helped to make a bad situation worse in the South. Canadian roads have also felt the depression. The *Chronicle's* preliminary statement of gross earnings for September covers 91,124 miles on which there is reported a loss in gross earnings of $5,747,837, or 7.05 per cent. Out of the whole 43 roads included in the table, there are only nine that are able to record an increase. The Chesapeake and Ohio, which is steadily forging ahead, is one of these. The Mineral Range, though a very small road, has a substantial amount of increase, because comparison is with the strike period in the copper mining regions of Lake Superior last year. The "Soo" road and the Minneapolis and St. Louis also have increases and are doubtless benefited by the large movement of spring wheat induced by the high price prevailing for wheat. The Canadian Northern is the one large Canadain system able to record an increase. In the following we show all changes for the separate roads for an amount in excess of $30,000, whether increases or decreases. The list of decreases, it is observed, is a long one.

PRINCIPAL CHANGES IN GROSS EARNINGS IN SEPTEMBER.

	Increases.
Chesapeake and Ohio	$242,615
Canadian Northern	115,000
Minneapolis and St. Louis	65,197
Minneapolis, St. Paul and S. Ste Marie	36,408
Mineral Range	35,452
Representing 5 roads in our compilation	$494,672

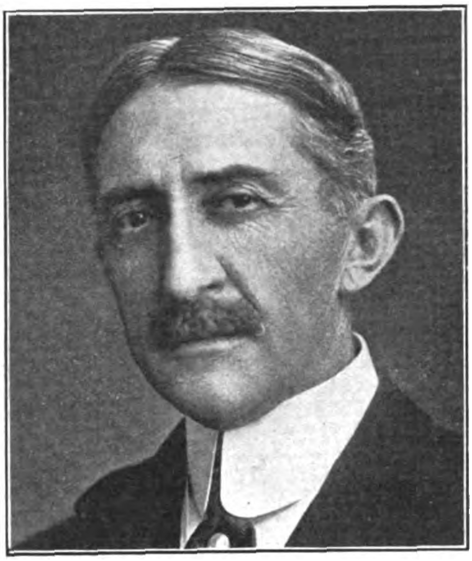
	Decreases.
Canadian Pacific	$1,408,000
Louisville and Nashville	683,141
Great Northern	669,594
Southern Railway	460,362
Seaboard Air Line	364,369
Illinois Central	321,631
St. Louis Southwestern	239,000
Missouri, Kansas and Texas	209,598
Grand Trunk	199,080
Buffalo, Rochester and Pittsburgh	191,448
Missouri Pacific	190,000
Yazoo and Mississippi Valley	178,714
Colorado and Southern	154,521
Wabash	139,786
Mobile and Ohio	133,976
Chicago and Alton	132,333
Cincinnati, N. Oleans and Texas Pacific	129,060
Denver and Rio Grande	128,400
Texas and Pacific	108,941
Chicago Great Western	49,926
Western Pacific	40,200
Duluth, South Shore and Atlantic	38,662
Chicago, Indianapolis and Louisville	37,742
Alabama Great Southern	36,268
Representing 24 roads in our compilation	$6,203,752

Southern Railway Elects New Members to Board of Directors.

MR. EDWIN A. ALDERMAN, president of the University of Virginia; John Kerr Branch, banker of Richmond; Dr. John C. Kilgo, of Durham, N. C., Bishop of the Methodist Episcopal Church, South; Robert Jemison, of Birmingham, Ala., and Charles Steele, of New York, were recently elected directors of Southern Railway Company, thus making a majority of the board Southern men and fulfilling the hope expressed by President Fairfax Harrison in his first address before a Southern audience when at Chattanooga on January 20, he said: "I look forward to the time when there may be more Southern men sitting on our board of directors."

Mr. Steele succeeds himself, the four new directors filling vacancies caused by the death of Messrs. W. W. Finley and H. C. Fahnstock, the resignation of Mr. George F. Baker, Jr., of New York, and the declination of Judge E. H. Gary, of New York, to accept re-election. Judge Gary, who is chairman of the board of the United States Steel Corporation, and Mr. Baker, who is allied with a number of other corporations, are retiring from the board of directors of Southern Railway largely in deference to public opinion of the present day in regard to interlocking directorates, despite the fact that both have been active and useful members of the Southern board.

The meeting of the stockholders on October 13th, was the first at which they have had the opportunity to directly take a hand in the management of its affairs and the election of directors, the voting trust which has been in control since the organization of the company in 1894 now being in process of dissolution.



EDWIN A. ALDERMAN.

President of the University of Virginia, who has been elected to the Board of Directorship of the Southern Railway.

A large number of stockholders attended the meeting in person and over 90 per cent of the total capitalization was represented. The meeting was open to the public and there was full and frank discussion of the report covering the operations of the company for the fiscal year ending June 30, and of the recently accomplished financing before approval was voted. A number of the directors and the principal officers were in attendance and answered questions asked by stockholders touching the management of the property and gave all information requested in regard to the affairs of the company and the progress of the territory which it serves.

ROBERT JEMISON OF BIRMINGHAM, ALA.

Who has been elected to the Board of Directorship of the Southern Railway.

Northern Central Revises By-Laws.

THE board of directors of the Northern Central Railway Company has made the necessary revision in its by-laws and organization to accord with the conditions under which its railroad is operated by the Pennsylvania Railroad Company under the lease. The vice-presidents, who occupied similar positions with the Pennsylvania Railroad Company, in charge of operating, traffic, financial, real estate and other departments, retired, because they will hereafter perform these duties for the lessee company. Mr. Samuel Rea continues as president, Mr. Michael Jenkins, of Baltimore, and Mr. A. J. County, who performs similar duties for other leased lines in the Pennsylvania System, were elected vice-presidents.

Baltimore and Ohio Plans Issue of General Refunding and Improvement Mortgage.

IN connection with the call for the annual meeting of the stockholders of the Baltimore and Ohio Railroad, which will be held November 16th, it is announced that at that time a plan will be considered for issuing a general refunding and improvement mortgage, and President Daniel Willard gives a brief explanation of the scope and purpose of this mortgage in a communication which is being mailed to the stockholders.

While the amount of the bonds which will be issued under the mortgage is placed at $600,000,000, unless the stockholders should later give further consent to an additional issue, it does not necessarily follow that there will be any large increase in the mortgage issues of the Baltimore and Ohio Railroad, but after providing for the refunding of the existing obligations of the company it makes provision for bonds which will be available for future years for additions and betterments to the property.

From the notice it is evident that the plan of the proposed refunding and improvement mortgage follows the general character of mortgages recently issued by the New York Central System, the Chicago, Milwaukee and St. Paul and the Northern Pacific Railroads.

Erie Railroad to Issue Car Trust Certificates.

THE Erie Railroad has applied to the up-State Public Service Commission for approval of a $900,000 car trust equipment, which George H. Minor, assistant general solicitor of the Erie characterizes as one of the most favorable the road has ever been able to project, despite the disturbed condition of the financial market due to the European conflict.

The certificates, to be known as Series BB, will bear interest at four and one-half per cent, and Mr. Minor announced that Drexel & Co., of Philadelphia, have offered to purchase the entire issue for 97 and accrued interest. These favorable terms, Mr. Minor explained at the hearing, were due to the fact that the arrangements for the issue had been made early in the summer before the war scare. The actual issue has been postponed to this time on account of certain changes in the specifications for the equipment to be bought.

The Commission's Advance Rate Decision as Viewed By an English Railway Expert

NOTE: The following statement appears in the *New York Annalist* of October 5th, and represents a response made by Mr. W. M. Acworth, the noted English economist to a request for an opinion on the Commission's decision in the so-called Eastern rate advance case. While Mr. Acworth's reply was delayed, on account of the war, the fact that the Commission has again taken this whole matter under consideration, makes his remarks of a timely character.

I AM asked to say how the recent decision of the Interstate Commerce Commission in the rates advance case strikes an Englishman who for twenty-five years has been a close student of American railway matters.

The first thing that strikes me is that the Commission is a mighty poor hand at prophecy. "Shortly after the commencement of this proceeding," says the decision, "there began another period of depression from which we appear now to be recovering." The decision was given on July 29. On July 30 the Stock Exchanges in New York and London closed for an indefinite period; the next day the London Bank rate went up to 8 per cent; the following day to 10 per cent; the day after Germany declared war on France and Russia, and violated the neutrality of Belgium.

During the argument of the case the carriers pleaded that "they would encounter great difficulty in renewing their maturing short-term notes and other obligations." "Subsequent developments have," says the Commission, "shown that there was little evidence for any such view * * * * with the growing ease in the money markets this difficulty has largely disappeared." I have not heard of any short-term notes that have been renewed in Europe since July 29; nor do I imagine that the bankers in New York are tumbling over one another in their desire to renew them at home.

One would have thought that the Commission would have appreciated, after the failure of their prognostications in 1911, the danger of prophecy. In their decision of the rate advance cases in that year the then Commission prophesied, "The cost of supplies will not much advance. Wages will not much increase." To-day the Commission says, "The most important items (in transportation expenses) are the cost of fuel, and the wages of employes. * * * * The average price of coal increased 7.7 per cent from 1910 to 1913. * * * * Exhibits filed in this proceeding indicate an increase of 9.02 per cent in the average daily wages paid in 1913 as compared with 1909, and that if the scale of wages for 1909 had been in effect during 1913 the labor costs of the latter year would have been less by about $51,000,000 than they actually were." The maximum increase of rates asked for by the carriers was not more than $50,000,000; less, therefore, than the increased cost of operation due to wages alone in the single department of transportation.

Another thing that strikes me of a general nature is that the Commission do well to describe themselves as exercising quasi judicial functions. It is a maxim of the common law that in judicial proceedings every man is innocent till he is proved guilty. The whole of the decision of the Commission seems to me to be permeated and saturated with a quasi judical spirit which assumes that every railway is guilty till it proves itself innocent.

Let me at once say that I make no imputation of intentional unfairness against the majority of the Commission. It would be an impertinence to me to testify either to their competence or to their integrity. But I cannot help regarding their subconscious attitude as one more proof of the anti-railroad bias—based on and no doubt largely justified by historical causes—that normally characterizes in my judgment American legislators and American commissions.

This being the attitude of public authorities, it would be comic, were it not so serious, to note how the Commission refers to the railroads for relief to other public authorities. For example, the Commission says, "We make no suggestion in regard to railway mail pay, as that subject is under investigation by another branch of the Government. But it may be assumed that, if the compensation is found to be unjust to the carriers, relief will promptly be afforded." The facts as they have reached us here in England are that Congress appointed a joint committee to determine what would be just compensation, and that, as soon as it became evident that this committee would report in favor of payments on a more liberal scale, Congressman Moon at the request of the Postmaster General introduced a bill not merely reducing the already inadequate mail pay, but also constituting the Postmaster General judge in his own case.

Take another instance: the Commission says that passenger fares are too low, and points out that they have been forced down by legislative enactment. "But we are confident,' 'they continue, "that, if the statutory fares are clearly shown to be unduly burdensome" (the Commission says that they have been shown to be) "the people * * * * will cheerfully acquiesce in reasonable increases * * * * and that the necessary legislative authority will be promptly given." How the cheerful acquiescence and the necessary legislative authority are to be secured the Commission does not explain, though it does elsewhere point out "the general impropriety" of a campaign of publicity.

Perhaps, however, the Commission would approve of a campaign of publicity directed to the legislature, though not to the Commission itself. I confess myself that I am unable to appreciate the distinction. "The law," they say, "fixes the standards by which the rates and fares of carriers must be judged, and the Commission can act only in accordance with these standards. We have no authority to approve rate increase with a view to stimulating business." I confess myself that I do not understand this. The duty of the Commission is to satisfy itself, after full hearing of all objections, that the rate, or the increased rate, is just and reasonable. Is not the fact that 1 or 100 or 1,000,000 members of the public who have to pay the rate think that they would gain more by the stimulation of business than they would lose by the higher railway charge, evidence for what it is worth that the increase is reasonable? I have always hitherto thought that one great advantage of your quasi judicial commission over our purely legal commission was precisely that your commission was entitled to and did take into account the whole circumstances of the case, and was not confined, as our commission is, to the consideration of evidence given on oath in open court.

Let me notice another point. In speaking of the unprofitableness of passenger service the Commission says, "In our opinion each branch of the service should contribute its proper share of the cost of operation and of the return upon the property devoted to the use of the public." As stated, this is a platitude. Of course it should contribute its proper share. But the Commission apparently uses the phrase as equivalent to "its equal percentage share," an entirely different proposition. The answer is briefly that this share is only capable of very rough approximation, and, further, it is more than questionable whether the allocation of charges as between passenger and freight on the basis of cost of service is economically justifiable. It is certainly not practiced in any other business in the world. Does anybody suppose that the Steel Corporation or a departmental store makes the same profit on all branches of its business?

I confess I am deeply disappointed with the decision. It may have been right. It may have been right to refuse the advance. I am sure that the reasons for refusal are wholly inadequate. The Interstate Commerce Commission, both in the scope of its functions, the magnitude of the interests involved, and the distinction of its personnel, is the most conspicuous rate regulating body in the world. If they fail, it means the failure of Government regulation, and there is nothing before us but government ownership, which to my mind would be a disaster for England, but a greater disaster for America.

We looked for a decision showing a broad and statesmanlike grasp of an enormous question as a whole. It might have guided the policy of the railways of America for years to come. Instead we get a series of recommendations and of detailed suggestions for economy, some of them of the dimensions of the ridiculous mouse. These detailed suggestions are made by a body of amateurs to a body of experts, who have already, in the opinion of the experts of every other country, among a population the most extravagant in the world, built and operated a railway system undoubtedly the most economical in the world.

Further Discussion of Effect of European War on Railroad Business

By Ivy L. Lee, Executive Assistant, Pennsylvania Railroad.

Note: In the September issue of the Railway World extracts were published from an address delivered by Fairfax Harrison, president of the Southern Railway at the Labor Day celebration in Spencer, N. C., on the effects of the war upon the railway industry, particularly in its application to the Southern Railway. The extracts that are published herewith from Mr. Lee's address, which he delivered at a mass meeting of Pennsylvania Railroad employes at Altoona, Pa., on September 29th, are in effect, a continuation of the discussion on this subject.

THE war has brought us face to face with a crisis in the railroad business. It is true that other lines of business are also faced with a critical situation, but the railroad should receive sympathetic attention for two reasons: (1) That its function is one of the necessities of civilization, and (2) That its property although privately owned is devoted to the public service.

At the close of the war or even during the war, if shipping and exchange facilities can be re-established, there is likely to be a spurt in business in the United States to supply the needs of the world. But the disarrangement in the machinery of trade is vital and may have results of far-reaching magnitude. In concluding a careful analaysis of the effects of the war upon the world's trade in its issue of August 22, 1914, the London *Statist* said:

"The reduction to poverty of the losing nations, and the waste of wealth and consequent diminution of purchasing power all around, cannot but adversely affect for a long time the prosperity of the whole world."

Whatever the effects of the war may be, it is certain that the United States will suffer least among the great nations of the world. Whether the war will lead with us to a period of great commercial activity or to a period of depression, this much can be safely predicted:

There will be a very material and world-wide increase in interest rates, and the demand for capital will be upon an unprecedented scale.

This would be inevitable if the world had no more to take account of than the cost of the war and of replacing the destroyed wealth now thrown into the cauldron of war.

Europe can pay her own debts by liquidating a large portion of her holdings of American securities. It is estimated that from three to seven billion dollars of our capital liabilities are now held abroad. Inevitably, we shall have to buy back a huge quantity of these, once a free security market is re-established.

We cannot possibly look to Europe for new capital for several years to come, and we shall be obliged to finance our own past enterprises. If we are to enjoy an era of expansion, we shall have to finance that too.

It thus becomes incumbent upon us to make our securities so attractive that Europe will be disposed to withhold them from sale as long as possible. As our railroads are, as President Wilson says, "at the very heart of most investments," we must see to it that our railroad liabilities are made sound and that fortifications are erected against the possible siege.

Bond and note obligations of American railroads maturing before the end of next year aggregate over $520,000,000. The Pennsylvania Railroad must next year refund some $96,000,000 of capital liabilities. In addition the amount of new capital required for the normal development of the American railroad system amounts to upwards of $400,000,000 per annum.

And yet what is the railroad situation? In general, it is one of reduced revenues and of inability to reduce expenses to correspond. Anybody will concede that the Pennsylvania is an ably managed railroad; that it has not watered its stock; that its accounts have been accurately kept; and its money carefully spent. The evils of American railroads that are sometimes complained of are not laid at the door of the Pennsylvania. But what is the Pennsylvania situation?

During the four years ended June 30, 1914, the Pennsylvania System increased its investment in railroad property by over $272,000,000. During that time its gross earnings derived from an increased service to the public increased over $34,000,000, while its expenses increased nearly $55,000,000.

Thus at the end of four years, after having dedicated $272,000,000 irrevocably to the public service, the System's net revenues were worse off by $21,000,000 than they were before the $272,000,000 had been spent.

Obviously that is a situation which must be met. It is a situation which has been intensified by the war, for now obviously a higher rate of return upon all investments must be earned else new capital cannot be obtained and the price of existing securities will inevitably fall.

There are many impediments in the way of reducing expenses. For example, there are arbitrary laws compelling the employment of unnecessary men. An examination of our accounts shows that the lines of the Pennsylvania System spent last year upwards of $1,100,000 on account of the extra crew law alone.

The management of the Pennsylvania Railroad would shrink from reducing wages. The System paid in wages last year about $190,000,000. This was at a rate of wages nearly 35 per cent higher than that which prevailed in 1900, and over 10 per cent higher than those in 1909.

The Pennsylvania has always paid a dividends on its stock. Its policy has been to pay moderate dividends, and make those dividends regular and reliable. No corporation in the world as a consequence enjoys a greater confidence on the part of the investing public. Over 90,000 persons are investors in Pennsylvania stock, nearly half of them women. The Pennsylvania dividend, conservative as it is, should continue to be a bulwark of American railroad finance. Its permanence and safety constitute an assurance to the public that the public service of the greatest railroad in the world will be maintained at a high standard.

It is believed that the public is coming to understand the importance of seeing to it that proper protection is given to the earnings of railroads,—"the one common interest of our whole industrial life," to use the words of the President of the United States.

The employes of the Pennsylvania Railroad have in the nearly 70 years of the company's history given signal illustrations of loyalty and efficiency. In reciprocity for what we believe will henceforth be the more liberal attitude of the public, there now rests upon the employes of the Pennsylvania Railroad an obligation of supreme moment.

The public must have the very best service which it is possible to give with the money that is available. And economy must be the watchword. The awful waste and destruction of war can only be replaced, and its effects minimized, by most rigid economy on the part of governments, corporations, and individuals everywhere.

This is a time when every railroad employe must realize that in a peculiar sense he is a trustee; a trustee of the investor's money, a trustee of the money the public has paid for his service. In so far as each officer and employe acts in every detail for the railroad as though he were using or spending his own money, just in so far will his responsibility as trustee be fulfilled and his company able to perform its high obligation to the stockholders and the public.

Trade Developments in Foreign Countries

By D. J. Donovan.

Note: Much has been said in the public press recently regarding our increased trade possibilities with South America, owing to the European war. Such possibilities are no doubt, greater at the present time than ever before, but it should be remembered that the trade is not there merely for the asking but owing to the methods employed in the past by European exporters, must be handled on a credit basis which requires banking affiliations not at the present time sufficiently developed to insure the full benefits which the present abnormal conditions have made possible. Furthermore, a large amount of educational work will be required to thoroughly familiarize South American merchants with the ability of our manufacturers to supply their necessities and the trade must be intelligently worked for and honestly catered to, if full advantage is to be taken of the opportunity. The following article by Mr. Donovan which recently appeared in the official organ of the Chicago Traffic Club, points out some of the difficulties to be encountered and some of the steps to be taken in order to overcome them.

THERE has been a good deal of advice offered recently as to increasing our export trade, particularly with the countries of South America. The fact that the principal countries of Europe are at war with one another gives us an opportunity to develop and increase our trade with Argentine, Brazil, Chili, Peru, and the other South American nations, freed from their competition, to a degree never known before. But merely to know where trade may be had, is no open sesame to securing it. The United States does a large business with the various countries of South America. It is capable of being expanded till the volume of our business will rival that of Europe, where many of our great manufacturing enterprises are entrenched and represented by their own establishments. Great commission houses also are the intermediaries by which millions of dollars' worth of business is handled every year.

The growth of our trade with South America has been steady; it covers many years of development; in some years development has been rapid owing to a variety of circumstances. It may be said that in the past, extension of our export trade was in a great measure coincident with slack demand at home. How rapid on the whole, and how steady has been the growth of our South American trade may be noted by calling attention to the fact that in the early '90's, the business between the United States and the Argentine was carried on by sailing vessels of from 500 to 1,000 tons register, two or three sailings a month, giving ample freight accommodation to shipyers. To-day steamers of 12,000 ton register carrying freight and passengers are engaged in the trade. And what is true of the Argentine is true of other South American countries, such as Chile and Brazil.

In the days of the sailing vessels many were American owned and flew the American flag. The freight money came to the United States and helped the credit side of Uncle Sam's dealings; later on the trade with the Argentine, as well as with other countries, was carried on by steamers, and naturally the greater growth of trade, the greater our debit balance to Europe grew; or to put it another way, we only got credit for the merchandise we sold to the Argentine, while the freight monies went to the credit of foreign shipowners who did our freighting for us. The bulk of the exports of South American countries consisted of raw materials, wheat, corn, oats, hides, wool, nitrates, copper, meats and other products that could be classified as raw material; these were mainly sold in Europe Great Britain being the principal buyer; the freight money for the ocean carriage also was paid mainly to English shipowners. Naturally this established great credit balances in favor of South American merchants; they in turn bought heavily of the manufactured goods that Great Britain and other countries of Europe had to sell. It was natural as the trade grew for English manufacturers and bankers, to establish their own houses or agencies in South American cities and they became in the course of time as familiar with the standing and resources of South American firms as they did with their own business concerns at home. Their shipping lines established their own agencies in the ports of South America and advertised the sea power of Great Britain, and with the establishment of regular lines of steamers composed of fast boats, the trade increased and the South American markets took a greater variety of goods and of increased value. Investment of European capital in railroads, harbor works, water works, light and power companies, induced South America to favor Great Britain in making purchases as against the United States. Credit was extended to South American business houses; the needs of their markets were carefully gone into; Europeans sold what the South Americans wanted; they cultivated their trade persistently and assiduously and on lines of permanency: a policy which all the manufacturers of the United States seeking export trade, have not yet adopted.

The policy of the merchants of Great Britain in their method of trading with the Argentine and other countries of our continent to the south of us, has borne fruit. Argentine has made marvelous progress in wealth and population. The same factors which aided our prosperity also made for theirs. The consumption of wheat the world over has rapidly increased; the surplus of the United States and the surplus of all other producing nations has been readily consumed and at good prices in recent years. Argentine has become a great producer of corn; her meat production has become enormous and found a ready market in Europe in recent years, for all she could spare, at increasing prices; and until the last ten months, all this vast cereal production of hers was sent to Europe, and established her basis of credit. Now a great deal of it comes to the United States, as our own production is inadequate to easily supply our own needs.

With the terrific eruption of war in Europe came a stoppage of their export business to South America as well as our own. Her credits with European bankers are not available and her credits with bankers of the United States are of a limited volume. Naturally trade between the United States and all of the South American countries halted; the triangular channel in which the trade was hitherto financed was blocked by the war, and until a new channel is provided or the war comes to a stop, business must be reduced in volume.

Much is said of the lack of steamer lines operating between the United States and South America; this may be dismissed with the statement that there are more than enough steamship lines and steamers to carry all the freight offered for shipment from the ports of the United States to the ports of South America. The difficulty which has halted our trade in Argentine, and Brazil as well, is financial; our merchants will not sell unless they are assured of payment for their goods; we have no machinery by which credit may be extended to foreign buyers with safety to all concerned; (this is, of course, a general statement, and does not refer to those concerns which have their own offices and agents established there); but this barrier promises to be soon swept away. The National City Bank has arranged to establish branches in some of the cities of South America, including Argentine, and in due course of time some of the handicaps the merchant of the United States suffers from will be a thing of the past.

There are, however, steps which should be taken in order to insure a steady growth of our exports; catalogues should, if possible, be printed in Spanish and English, for Argentine merchants: if that is too expensive, then it is better to print them in Spanish. The price of goods should be made f. o. b. the port of shipment in the United States. The price quoted should cover an Atlantic, and a Gulf port as well.

The ocean rate of freight should also be given in the catalogue; it, of course, need not necessarily be the lowest possible rate that may be secured, but a rate that may be safely figured on for a period of a year and which will stand good, barring unexpected contingencies, such as war, as the buyer of American goods in a South American port must know with some degree of accuracy what his goods will cost him landed. The gross and net weight of the package in which goods are put up should be given. The three measurements, and the total cubic measurement should be stated. If the cost of packing is included in the price of the goods, that should be so stated; if not, some idea as to the packing costs ought to be given. A merchant of South America is many thousand miles from the buyer of the United States. He has no means of knowing what the rail freight will be from a point in the interior of the United States to the port of shipment. Neither has he knowledge of what the ocean freight will be; and yet if he is to sell his goods at a profit he must know what his goods will cost him in his home port. This is a phase of export business that our merchants seeking export trade too frequently overlook.

To cultivate this trade of South America is expensive; the ocean voyage is a long one; their markets are well covered by European manufacturers who know the trade and its needs and who are willing to extend long time credit, and charge accordingly for so doing. It is, therefore, no easy matter to introduce new or competitive goods in those markets; the present time is the most favorable known in a generation, and if taken advantage of properly, the foundation can be laid for the gradual transfer of the trade of Europe to the United States in those commodities which the United States produces in competition with Europe. In our country we have export associations, and traffic associations in great number. With them many manufacturers are affiliated. It should be possible for those manufacturers wanting an outlet for their goods to combine and send a representative to Buenos Ayres, taking samples along, and they must be able to give the price landed in Buenos Ayres; be able to assure buyers that the goods are standard and staple, and that weights of packages and measurements may always be counted on. To many manufacturers these seem unnecessary particulars, but they are essential to the buyer, as he must have them in estimating the cost of his goods landed in his home port.

Recording and Classifying Railway Accidents

On October 15 Mr. R. H. Newbern, superintendent of the insurance department of the Pennsylvania Railroad System, addressed the National Council for Industrial Safety on the safety problem of railroads. Mr. Newbern said, in part:

"On the Pennsylvania System, employing normally 225,000 men and carrying over 185 million passengers and with a freight movement exceeding 385 million tons annually, there are 60,000 reports of accidents to employes and 10,000 reports of injuries to passengers and others forwarded to the company's insurance department. In order to simplify the handling of this large number of reports, the 'Hollerith' system was adopted and a code prepared showing causes, nature of injuries, occupations, locations, days disability and other items of information necessary in the analysis of accidents. As the reports are received they are codified, each item of information being marked with its designated code number and a permanent record of the accident is transferred to a card by means of a punching machine, and when statements or data are needed for the information of the executive or operating department or for the guidance of the safety organization, the cards are sorted by means of machines and the desired information obtained quickly, accurately and economically.

For statistical purposes employes are separated into two classes, one, employes in the maintenance of equipment, commonly known as shopmen, and the other, all employes, such as trainmen, maintenance of way men, station men, etc., designated as road and yard men.

The statistics provide for the following information:

The number killed and injured by detailed causes; nature of injury by cause and occupation; length of disability; occupations; length of service; time of day or night; weather conditions; division; grand division; shops; large stations and yards.

The statistics are compiled on the same basis for shop and road and yard aaccidents, excepting as to detailed causes, there being 360 shop causes and 340 road and yard causes, making 700 separate causes of accidents. The causes in turn are classified under 36 general headings which indicate the nature of the work at time of accident.

By comparing the number of accidents under each general heading, we ascertain what kind of work is the most hazardous and the specific cause under which the accidents are reported. The primary cause of every accident is indicated. The records are kept by the divisions, shops, stations and yards, and it is, therefore, easily seen at what points any particular kind of accident is most frequent.

There are included in the statistics additional information bearing an important relationship to accident frequency, such as the average age of employes, length of service, etc. Regarding the length of service, it was found that during the year 1913 there were 90,000 new men employed, although the total increase in the number of employes for the year was less than 9,000, the greater number of transient employes being in the maintenance of way department. The statistics developed the fact that during the year 25 per cent of the men killed and injured had less than six months' experience and that 28 men were killed and 2,391 injured who had been in the service less than 30 days. Assuming a similar experience on all the other railroads of the United States, at least 360 men were killed and 15,000 injured last year having less than one month's experience, and many met death during their first week's work—not because they were careless or fool-hardy, but because they were ignorant of the hazards of the work.

A business employing men in more than 100 occupations will be unable effectively to teach the doctrine of safety unless some means are provided to discover the number of injuries sustained by men in each specific occupation. The statistics, therefore, are so arranged that the number of injuries and fatalities can be shown in each department and to each occupation of the various departments, also the reports are tabulated to show the specific cause for each occupation.

The number of accidents occurring during each hour of the day or night is shown as the time of the accidents suggests various preventives, such as improved lighting facilities and rearrangement of working hours.

A statement of so many men injured on railroads during a certain period does not convey a proper meaning; it is the loss of time that shows what the employe really suffers. Therefore, the statistics provide for the number killed, the number injured, the number of indefinite injuries and the actual number of days lost. Our statistics include all accidents resulting in a disability of one day and over. It was found that 18 per cent of all the injuries involved less than four days' disability, and the number of "15 days or over" accidents (the minimum period covered by liability laws) amounted to 50 per cent of the total days' disability.

Our statistics also show the nature of the injury; this information embodies 141 different kinds of injuries, included under the following general headings:

Amputation, fractures, eye injury, electrical shocks, sprains and strains, burns, bruises, dislocations, incised wound or laceration, injuries not included above.

This information enables the management to study methods of treatment to reduce the length of disability. Take the subject of fractures for example: There were 758 cases last year resulting in 19,190 days of disablement, 87 indefinite disability cases and 53 fatalities. The medical profession recognizes the necessity for the best treatment of these injuries, as fractures may result in extended disablement on account of improper treatment.

Our experience clearly indicates that comprehensive accident statistics furnish a most effective means of suggesting remedial measures in accident prevention work.

Automatic Safety Devices on the Panama Railroad

Note:—The following record covering the installation and operation of automatic safety devices on the Panama Railroad, will prove of interest to American operating officials in view of the fact that on account of the peculiar local conditions involved, it was found necessary to incorporate many original details into the general scheme of protection in order to obtain the desired results. Aside from these details, the standard signal practices in the United States have been closely followed.

WHEN the old main line was in service, prior to February 15, 1912, the heaviest main line traffic was carried over double track. Trains were operated and spaced by manual block signals. This plan of handling traffic was necessary at that time, because the chief train dispatcher would not have been able to issue the "Running orders" for so many extra trains, and the flexibility of the caution aspect on the manual block signal, in addition to a rigid enforcement of the yard limit rule, allowed trains to follow each other at a less distance than could be successfully accomplished by automatic block signals. When the old main line between Gatun and Gorgona was abandoned and traffic partially shifted to the single track on the relocated line, conditions changed, and the factor of safety had to be given immediate consideration, resulting in the following program:

First—A scheme of signal aspects as simple as possible, but sufficiently flexible to care for present and future traffic.

Second—The preparation of a book of signal instructions covering such aspects, and later, the revision and rearrangement of the "Book of Rules" which included these instructions.

Third—The examination of all transportation men on the rules, and their instruction as to the use of signals.

Fourth—The protection of congested points by interlocking plants, or other mechanical signals; also, the protection of the main track on descending grades by derails located in sidings and operated from the switchstands.

Fifth—The installation of automatic block signals as fast as permanent track and reduced traffic conditions would permit.

Delays of various kinds, however, made it impossible to entirely fulfill the fourth and fifth requirements above mentioned. The signal instructions were issued to the transportation forces early in 1912, and a description of these aspects appeared in "The Canal Record" of November 13, 1912. The revised "Book of Rules" was distributed in December of the same year. Examinations were held at various points on the Isthmus in a baggage car assigned to that service. A committee, representing both the Isthmian Canal Commission and the Panama Railroad, was appointed to conduct these examinations, and to explain the new scheme of signaling. It required approximately four months to examine and instruct the 450 transportation men. These were taken in classes of ten or twelve, and the average time required per class was eight hours. The committee's aim was to demonstrate the relation between definitions, rules, and train orders, but the real test consisted in writing 38 typical train orders on a blackboard; in this manner, 51 vital points were brought out through questions and discussions.

The protective devices now in use on the Panama Railroad consist of interlocking plants, station signals, switch signals, pipe-connected derails, and automatic block signals. During the past two years, the disc signal aspect has been eliminated, and all existing semaphore arms were changed to operate in the upper right hand quadrant. During the same period, 23 interlocking plants, with 365 active levers, 66 station signals, 18 switch signals, 26 pipe-connected derails, two staff machines, and 122 automatic, or other power operated signals were installed. Many of these have been changed or rebuilt to keep step with the changing conditions, and within the past few months, some unnecessary apparatus has been removed.

At old Tower R, the train movement at one time averaged one train for each one and two-thirds minutes. This average for nine hours is one, it is believed, that has been rarely exceeded in the busiest terminals in the United States. Circumstances made the installation of a mechanical interlocking machine necessary, and the time element was so valuable that derails had to be left out of the combinations, in order to save the few seconds of time required to handle the additional levers. In order to expedite line ups and prevent confusion, the yardmaster, located in the upper story of the cabin, indicated all routes on an electric track diagram by the means of push buttons. Electrical adjuncts, such as indicators and power operated signals were added, in order to safely expedite train movements through the interlocked limits of old Tower R, and electrical connections to Gamboa cabin protected traffic from head end movements while on the Gamboa bridge. This plant was in operation for seventeen months, and during that period no accidents or collisions occurred within the protected territory.

In March, 1913, when the heavy dirt train traffic was shifted from the Canal tracks on the lower level to the Panama Railroad main line and passed through the Miraflores tunnel, it was necessary to incorporate a better system of protection through this congested territory. An absolute staff system was installed and the converging tracks at North cabin and South cabin interlocked. This apparatus was described in "The Canal Record" of January 11, 1913. In the above arrangement it was also necessary to omit derails on two of the tracks leading into the tunnel for the simple reason that the time required to handle even two additional mechanical levers was so valuable that it had to be considered. During the existence of the heavy traffic, it was no uncommon occurrence to pass 230 trains through the tunnel between 6 A. M. and 6 P. M., and the daily average was over 200 trains. With the maximum traffic, as enumerated above, the capacity of the tunnel and the staff system was taxed to the limit. The staff system controlled this territory for over thirteen months without an accident, but on account of a recent reduction in the number of trains, it was superseded by automatic signal protection, covering the gauntlet track installed through the tunnel a short time ago.

The automatic scheme now in use at the tunnel is so designed that the automatic signals stand normally in their "Stop" position. A train approaching with the current of traffic from either end enters a clearing section 1,500 feet in advance of the signal. If all conflicting entrance points and the gauntlet are unoccupied, the signal will change to "Proceed," and allow the train to pass on through the tunnel. If not, the signal arm will remain in the horizontal position. Movements against the current of traffic are controlled in the same manner, except the clearing sections are only 150 feet long, requiring the train to come to a full stop before entering the tunnel. The first train entering a clearing section will receive a "Proceed" aspect regardless of right, class or direction. This change represented another compromise on the side of economy, and safely handles the present traffic without any manual assistance at either end of the tunnel.

A number of questions have come up within the past few months relative to automatic stops. When a railroad has to resort to automatic stops as an additional check upon the human element of its traffic personnel, it immediately removes the responsibility from the engineman and places it in the hands of the signal maintainer. Such a step is, according to general belief, not in accordance with the fundamental principles of good railroading, as the engineman should at all times have complete control of his train, and with the scheme of aspects on the Panama Railroad and their controls there appears to be no reasonable excuse for overrunning a signal in its stop position. To fill all requirements, an automatic stop should be able to successfully cover the following:

1. It must have continuous control.
2. It must operate with the engine running either forward or backward.
3. When two or more engines are on one train, it must affect the leading engine only.
4. It must operate on both steam and electric propulsion.
5. It must comply with and stay within the theoretical clearance of both roadway and equipment.
6. It must work under all weather conditions.
7. It must stop a train should any of its parts be damaged or missing.
8. It must not be dangerous to passengers and employes.
9. It must be sufficiently rugged to withstand wear, tear and vibrations.
10. It must be convenient for inspection and repairs.
11. It must register each train stop it has made.
12. It must allow a train to pass a "limited speed" aspect below a predetermined speed, or stop such trains if the speed is greater than the maximum speed allowed.
13. It must make an application of the air in beginning to stop a train, regardless of speed, at not less than 4,000 feet in advance of any home or automatic signal with its arm in the horizontal position.
14. It must be so arranged that an engineman cannot cut the apparatus out of service during the trip, and, in the event an automatic stop is made, it must be necessary for him to get under engine or tank to release brakes.
15. It must be so arranged that trains cannot enter the main track at any point unless the route is unoccupied and the switch indicators show "Proceed."

With these requirements in sight, it is seen that undue complications enter into such schemes of safety devices; that they place the movements of trains subordinate to the factor of safety, shift responsibility to the wrong personnel, and reduce the actual capacity of the main track from twelve per cent to 35 per cent, according to the spacing of existing signals. The local conditions on the Panama Railroad and the personnel in the train service make automatic stops unnecessary.

INTERLOCKING PLANTS.

The protection offered by the interlocking plant is confined to a restricted territory, such as a railroad crossing, a junction, end of double track, etc. On the Panama Railroad, all plants are mechanical. The locking and machines are built in the field, and all material is in accordance with the latest signal practice.

The cabin contains the machine the levers of which correspond to the outside functions, and they are so interconnected that all levers must be manipulated in a predetermined sequence. This arrangement gives the signalman complete control over all switches, derails and signals connected to his machine. The connections from the lever to switches, derails and detector bars are made by 1-inch pipe specially riveted and carried on antifriction pipe carriers; this pipeline has a travel of 8½ inches, and turns are made with bell cranks. All pipelines over 150 feet have to be compensated for changes in temperature. The connections to mechanical signals are made with No. 9 gauge (B. W.) special galvanized steel wire, supported on wire carriers, and require no compensation in distances less than 1,200 feet. Turns are made by inserting chain in the wire line and carrying this around 10-inch sheave wheels. Switches are locked by a round plunger the end of which is sawed square, and they are so adjusted as to "stick" if the points stand open three-sixteenths of an inch, or more.

To prevent a switch or derail from being thrown under moving equipment, a detector bar is placed alongside the rail. This bar is ⅜-inch by 2¼ inches by 55 feet, supported by 14 radial links, and operates through an arc of 120 degrees when being moved in either direction. It is placed on the outside of the rail, inclines at an angle of 15 degrees toward the center of the track, and rises one and one-quarter inches above the top of the rail, when on center. The presence of car or engine wheels over the bar prevents the signalman from throwing the lock lever, and as that lever locks the switch lever both inside the cabin and at the switch proper, it is, therefore, impossible to throw a switch under a moving train.

All signals are equipped with an additional check called a bolt-lock; this works in conjunction with derails and switches in such a way that the signal cannot be brought to its "Proceed" position unless the track is properly lined up, and, on the other hand, if the signal does not respond to the lever movement and go to its stop position as the signal lever is placed normal, the route cannot be changed until the signal is placed at "Stop" by some other method.

AUTOMATIC SIGNALS.

Automatic signals differ from manual block signals in several respects. They operate automatically, as their name implies, without any manual assistance. Except at Miraflores tunnel, they operate normally clear, instead of normally danger, as with the manual block, and they provide "space element" blocking, instead of "time element" blocking. Automatic signals space and protect traffic at all points outside of interlocking plants, giving both head end and rear end protection, as well as offering protection against broken rails, misplaced switches, and cars beyond the fouling point in turnouts. The control of the signal arm between "stop" and "limited speed" is actuated by track circuit controls ranging from four-tenths of a mile to 2.65 miles, according to grade, traffic and other conditions.

The continuous track circuit is the fundamental factor of their automatic operation. Battery at approximately one-volt pressure is fed to one main track rail; the current passes up this rail, through a 4-ohm track relay, and returns on the other rail to the battery. This current, in passing through the relay coils, energizes them and picks up the armature on the relay; this, in turn, relays a local current of about ten volts that operates the signal motor, energizes its slot arm, and holds the signal in its "proceed" position.

When a train enters the track section, its wheels and axles form a path of much less electric resistance than the relay, so the current takes that path and the relay coils being thus deprived of energy, cease to attract the armature, which opens by gravity. The local circuit is then interrupted, the slot arm disengages, and the signal arm itself falls to its "stop" position by gravity. The act of throwing a main track switch for a turnout places the same relative conditions in effect. The switch point mechanically operates a switch box that short circuits the rails in the same manner as the wheels and axles under the equipment. In order to prevent trains, running under clear signals, from being "sideswiped" the outer ends of all crossovers are also equipped with switch boxes, which require both ends of all crossovers to be left lined up for straight track. Every electrical and mechanical feature incorporated in the entire system is so designed that, should it break or any part of it be removed, the signal will go to "stop," thus placing a so-called signal failure on the side of safety in all cases.

The control of the signal arm from "limited speed" to "normal speed" is actuated by a polarized line circuit. The signal ahead feeds battery to the line through a quick acting pole changer; this circuit is then carried through front contacts on a 4-ohm relay at each track section to a 1,000-ohm relay at the following signal. The neutral armature is actuated by current in either direction, but, in addition to this, the 1,000-ohm relay has a polarized contact that is energized and moves according to the direction of the current. These contact points on the polarized relay are used to make or break an additional local circuit that controls the signal arm between its 45-degree and its vertical position.

Automatic signals may always be distinguished by a number on the front of the mechanism case. This number indicates, in miles and hundredths, the distance from Colon. Northward signals are always given even ending numbers, and southward signals uneven ending numbers. This scheme of numbering allows changes or additions without disturbing the individual numbers on other existing signals, and allows concise and intelligent telegraphic report to be made in case of a signal failure.

In introducing automatic signals into operating problems on the Panama Railroad, rapidly changing conditions and the peculiarities of the tropical climate developed many new details never before encountered, although, in general, the best signal practice followed by railroad systems in the United States has been observed. The maintenance of automatic signals on the Isthmus, however, requires considerable more work and a much more rigid inspection than in the United States. This is due to the deterioration of battery, the corroding effects of the climate on contacts, the tendency of finished iron parts to rust, and occasional injuries of various kinds received from outside agencies.

The automatic signals between Colon and Miraflores average 210,000 arm movements per month. The reported interruptions that are chargeable to the system have averaged less than fifteen per month. When the automatic signals are extended to Panama, some existing interlockings rearranged, and two additional plants installed, the factor of safety on the Panama Railroad will be co-ordinate with its other operating problems.

Statistical Control of Railroad Operation

NOTE: The following extracts are taken from an address delivered by Mr. W. M. Baxter, special investigator on General Manager's staff of the Canadian Pacific Railroad, before the September meeting of the Canadian Railway Club.

IN the early days of railroading, the use of statistics as a means of controlling the operations was very imperfect. Competition was not usually important and the railroads were of short mileage, reaching only a limited territory. The margin of profit was large on rates amounting to only a fraction of the cost of hauling similar goods in wagons or on pack trains. But the profits of the enterprise lured much new capital. Competition became keen, lines were extended, rate wars took place and the solvency of railroads soon became a matter of careful management.

The business of a railroad may be divided into two distinct departments, namely, acquiring traffic and moving traffic, which is similar in industrial enterprises to the selling end and the manufacturing end. A railroad manufactures and sells transportation.

The great difference between the producing of the railroad's commodity and that of a flour mill, or coal mine, from the viewpoint of management, is in the fact that the plant and equipment of the railroad is dissipated or spread over a large stretch of country, while that of the flour mill or coal mine is concentrated, so that all supervision must be delegated, most of the work being done by transportation units, which are continually changing their location, so that they cannot be supervised except in a scattered manner.

An unusually large number of employes must work without supervision and the margin of operating profit is exceedingly small, when compared to the average returns on the investments in manufacturing and farming.

Right here I wish to say that the gross earnings for 1913 of Marshall, Field and Company, Chicago, America's largest wholesale dry goods firm, was $2,000,000 greater than that of the Illinois Central Railroad System, and the interest on the investment was 14 per cent, while that of the Illinois Central was 6 per cent. You can well imagine the furore and condemnation and the howl of "watered stock" that would have been evinced from the public and politicians, if this railroad had earned 14 per cent. The Interstate Commerce Commission would more than likely have been in night session.

As the general manager usually spends the larger portion of his time in inspection and under normal conditions seldom directs the movements of trains, he sees but an infinitesimal volume of the company's business moved. As the scope of his vision is limited, other methods must be resorted to in order to check the operation. The means of accomplishing this is to separate the operation of the road into rigid and definite units and then to compare these units with similar ones on other roads, or with the same road at various periods, or with arbitrary standards chosen as guides, or bench marks.

Controlling a railroad by means of statistics might be defined as the process of determining the unit in each operation and then maintaining these units as nearly rigid as possible, seeing that they are collected, reported accurately and promptly.

The basic operating unit in freight traffic is the ton-mile, which is the product of the ton and the distance. The basic unit in passenger traffic is the passenger mile.

There are six important statistical units deducible from these two fundamentals, which are defined as follows:

1. The average train load, either freight or passengers, is obtained by dividing ton mileage and passenger mileage by train mileage.
2. The average carload, freight and passenger, obtained by dividing ton mileage and passenger mileage by the respective car mileage.
3. The average length of haul for passengers and freight respectively, obtained by dividing passenger mileage and ton mileage by the total number of passengers carried and the total tons moved.
4. Ton miles per engine hour obtained by dividing the engine ton miles by the number of hours the engines are in service.
5. The average revenue per passenger mile and per ton mile, obtained by dividing the freight receipts by ton miles and passenger receipts by passenger miles.
6. The average density of traffic per mile of road, obtained by dividing ton miles and passenger miles by the length of road.

It is unfortunate that this data cannot be given to the executives earlier than five or six weeks after the operations have occurred, owing to the enormous concentration and calculations which must be resorted to in arriving at them on a large system economically. While they are of final value in determining the general efficiency of the system, it is necessary to have a more immediate check in the form of current records.

Perhaps the most tangible source of daily information is the train sheet, which is received by the train masters, and superintendents, from the despatchers. This sheet records the movements of all trains on the division, showing their consist as to loads and empties and number of cars in the train, and sometimes shows the number of passengers carried on each of the passenger trains, as well as the general movements of traffic, the observance of schedule time, the cause of delays and weather conditions.

By this means of concentrating upon a number of primary officers as much first hand detail information as they can absorb, the foundation of statistical control has been laid.

The results of these primary officers' observations are collected and passed on to their next superior who receives similar reports from many such primary officers and in this way the operations of the road and work performed is reported with diminishing detail, until the chief executive is reached.

The division superintendent is undoubtedly the most important primary officer. The operation of his territory is reported to him daily, and frequently on congested terminals he receives certain information hourly. In addition to this daily data, he has a number of statistical sheets prepared monthly, which show in condensed form, sometimes graphically, the comparative results of a large number of operations on a division, one month as against another, one day as against another, and one year as against another.

When these records are graphically presented the sheets are ruled with a number of vertical lines, representing the number of days in a month, or the months in a year, or in other words, progress of time, while a horizontal ruling to scale represents volume or quantity, as is shown in the illustration.

In this way the directing officer can readily see for example what has been the average tons per train mile, and the average pounds of coal consumed per 1,000 ton miles for a certain district or territory for a number of months, compared with the same months of the previous year, or if the records have been kept for a number of years fair indication will be had of the season's effect on the traffic.

The important daily returns which a superintendent receives are those showing the number of trains of loaded cars, empty cars, and total cars received and forwarded in each direction at all of the terminals, also this same information for train movements at important intermediate points. He must know the entire train movement and the tonnage movement, and the failure to perform a given service of these movements as expressed in delays and other causes, must be thoroughly investigated and remedies applied. He is informed about the conditions of each of the yards and terminals on his division and also about outside important terminals, which may affect movements in his territory. He knows the demand for freight and passenger equipment and the class of each required at the various points, as well as the available supply, and the condition and amount of power to move it. All of this information is of a statistical nature.

The officer next superior in rank is the general superintendent. He has received through the superintendents statements showing by divisions the number of engines assigned, total number of through engines shown on the train sheets, the number of through freight engines out of a shop and available for service before a specified time, usually at midnight, the number of through freight engines in shop for repairs and reported as coming out within 24 hours, and those which will not be completed in 24 hours, and also the average mileage made by these engines in service, special engine assignments, such as wayfreights, passenger engines, switch engines, work trains, pick-ups, etc., together with general remarks on the entire power situation.

He also receives reports on the cars handled at stations, showing the number of cars of merchandise on hand and when unloaded, together with information relating to special car movements. He is also notified concerning traffic exchange at all foreign line connections and if there is a special traffic, originating in his territory, such as coal mining, or some big manufacturing industry, he is advised of the number of cars moved and supplied, and a statement of detentions and their causes, as well as a report on the weather. While these are the principal reports he receives there are numerous special and minor statements furnished or compiled in his office daily, weekly, and monthly, which are beyond the scope of this article.

It is evident that no general superintendent could exercise close watchfulness over the thousands of separate items which these reports cover, and in reality he does not. A man in this position not trained on the property could not make efficient use of them, as the information gained is not so much absolute as relative. As the great majority of the data he thus receives must be judged comparatively to be of use, the graphic method of recording statistics is perhaps most practical and is instantly read.

The general superintendent, being familiar with all the conditions of his territory and knowing how it ought to operate, can look for the deviations from the results he is expecting. It may be fairly said that his system of control is by deviations from known standards.

The general manager, however, receives a smaller number of reports dealing only with the principal topics. All of these general considerations and many other local ones, the managing executives have clearly in their minds, but accurate statistical information must be the basis of their judgment in any specific case. They must receive constant advices relative to the current productive power of various localities on the system, the state of the wheat crop, the cotton crop, the lumber market, or seaport traffics, so as to be able to foresee the possible future requirements necessary to handle the business expeditiously. This is again a matter of statistical organization, but it can be made to yield large results in actual operating efficiency.

The traffic department and the operating department must work hand in hand in their investigation of anticipated business, although from different motives.

The traffic manager is interested primarily in car supply and train service. It is his duty to secure the largest possible number of routings of business actually in sight and also devise means for creating business that is not in sight. His business is divided into two main classifications, local traffic and competitive traffic, and he requires daily statistics to show how his local traffic compares with his expectations or with other seasons, and it is of great importance to him to know how his local agents are handling the competitive situation.

Even the local traffic is probably competitive with the traffic of other roads serving other markets, and the traffic manager must gauge the prosperity of his local industries largely in terms of their output and this can be done only by comparative statistical data.

The intricacies of the mechanical department is perhaps most susceptible to statistical control. It deals with plain units in great variety, as for example, pounds of coal consumed per specified service as per train mile or ton mile, or engine miles between stoppings or axle miles per hot box. There are really myriads of details in the mechanical performance of cars and locomotives, which can be standardized by means of statistical records. And deviations from these selected or normal standards will show up in great contrast, thus plainly denoting where investigation and remedy is needed.

The superintendent of motive power and his primary officers are continually engaged in these investigations.

Statistics of earnings and expenses are the ultimate check on all of the road's records, and when taken in conjunction with the statement of work performed and shown graphically, present the final picture of the system.

Without knowledge of the work done, however, earnings and expenses are not an adequate means of control. Many roads west of the Mississippi River in the United States, operate for 60 per cent of gross earnings or slightly less, while in the East the average is nearer 70 per cent. Thus the operating ratio is an uncertain test of efficiency. The high rates in the newly settled parts of the country make relatively easy a showing which the best operation in the world could not accomplish in a territory of intense competition of long duration, where the struggle for business has reduced the margin of profit of the railroad to a minimum.

The Engineer's Part in Port Development

By Francis Lee Stuart, Chief Engineer, Baltimore and Ohio Railroad.

Note: The following extracts are taken from an address delivered by Mr. Stuart before the National Association of Port Authorities at Baltimore on September 8, 1914. As the question of railroad investment in terminals is one of absorbing interest at the present time, Mr. Stuart's discussion of some of the more important problems involved in port developments, will prove of unusual interest to our readers.

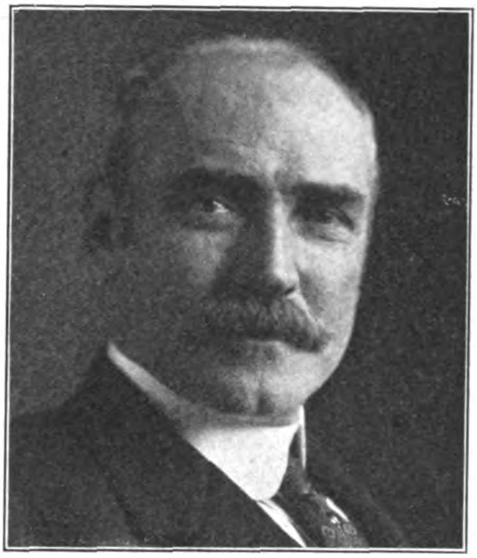
FROM the nature of the construction for port development an engineer is selected to design, oversee and superintend the physical construction of piers, docks, the dredging and various other works which pertain to the port, but I would like to impress upon you the importance of calling upon him for consultation on the larger aspect of port development. From the engineer's very training, they have been spending their lives in trying to sift the wheat from the chaff, get at the realities and to see things as they are, for the purpose of accomplishing results.

A port is that part of a large city which is used for terminal for water and rail and other transportation agencies. The port is so intimately connected with the city itself that the harbor section cannot be separated from the general problems of municipal growth, except possibly as to its finances, and must be subordinated and become only a part of the general municipal policy. Aside from the many minor influences on its development the two predominating influences in the proper solution to increase its efficiency for the comfort, convenience and pleasure of the community, and economy of service to the business and manufacturing interests are the water transportation interests and rail transportation interests.

Both of these transportation interests carry passengers, freight for local zones adjacent to and within truckage distance of a terminal, package freight for trans-shipment and bulk freight for trans-shipment.

In the matter of passenger travel, the movement of people from one section to another tends to a national spirit, a unity of thought, a greater degree of education and cultivation, an increase in business, an interchange between sections and the happiness and contentment of the people, and there is no more important civic matter for the comfort and growth of a community than that the distributing points for travel to and from a city should be so located that access to and from the homes and offices of the community should be with the least expenditure of time and energy in proportion to the length of the trip undertaken. Generally speaking, travel by rail far exceeds the amount of travel by water, and the railroad trip is a matter of hours while the water trip is a matter of days. Unless there are special conditions, the two interests do not compete, and one is forced to seek the waterfront and the other is usually located near the center of the city.

Freight for local zones had formerly, on the part of the water interests, been merely transfer of cargo between water crafts and horse-drawn vehicles. Economies required by competition have reduced these zones within the section of industrial utilities to a trucking distance of one or two miles, and evolution in the efficiency of pier use and the size of vessels caused a demand that this effective zone of influence should be increased by connection with rail interests, so that the other industrial zones of the city may be reached economically. On the railroad side, their entrance into a city and lines through a city have caused industrial zones to arise, which are served by local freight stations, and they have no desire for piers of this character except in zones along the harbor, which they are unable, for financial reasons, to serve by their own rails. When they do use pier space for this purpose, with their own water equipment, 100 per cent of the business passing through such a pier is for the convenience of the immediate industrial zone around that pier.



Francis Lee Stuart.

Package freight for the prompt dispatch and economical handling demanded by commerce, requires rail connection for the transfer of cargo between vessel and car, and where the larger part of the cargo is of this character the ship must seek such a pier.

Bulk freights for trans-shipment, such as coal, ore, grain, lumber, etc., require certain kinds of equipment on land and water, are trans-shipped at piers having special facilities and are usually, or should be, kept out of the congested industrial section of the harbor.

An analysis of the business handled and its relation to industries adjacent, and the economic requirements of both water and rail interests, would indicate that the logical preferences of locations of piers should be as follows:

1. Passenger business, such as ferry, excursion, short haul coastwise.

2. Piers for either railroad floating equipment or coastwise business of which 100 per cent of the freight passing through the pier is for distribution within a trucking zone to interests which have been built up on the basis of such a facility.

3. Shipping interests, the larger part of whose business is for local truckage distribution.

4. Ocean liners carrying passenger traffic and general cargo.

5. Ocean freighters carrying large proportion of general cargo.

6. Package freight for trans-shipment.

7. Bulk freight for trans-shipment.

For the first two classes rail connection with pier is not necessary and often, from the congestion caused at such points, not even desirable; for the third and fourth, rail connections with piers desirable, but not absolutely necessary; for the fifth, sixth and seventh, rail connections with piers a necessity.

There is a great difference in the financial and physical requirements of the interests for handling the various classes of business enumerated.

From the growth of the industries of our country the largest proportion of water freight is collected by the railroads and brought to the ports. Seventy-five per cent of the business of the coastwise shipping companies of the ports of the United States is for trans-shipment from a port to another port for distribution by rail to interior points, or received by rail at a port for transportation to another port for distribution. Ocean-going business is very similar to coastwise trade, and the largest proportion of ocean-going freight is collected at a port by railroad routes for transportation to another port for further distribution by rail.

For the shipping interests, the right of way is free and their capital account is practically the cost of the carrying units (the ship),—and their operating account, the running expenses and dockage facilities at their port terminals—and in their operation and methods of business they have a great flexibility, and are in the enviable position of being able to withdraw their carrying units from a pier, or unprofitable locations, or a port, or even a country, as the business demands. Their rates are made by competitive business conditions and not by commissions, except in so far as they are affected by wise or unwise maritime laws of the nations under which they sail.

The railroads, which are the largest co-partners or agents for the collection and distribution of freight for the water interests, are pre-eminently a part of the port as the shipping and should also be considered as one of the primary parts of a port.

The conditions under which their part in the port development is carried on should be borne in mind. Under a federal valuation act the Interstate Commerce Commission has undertaken the valuation of all the railroads of the United States, and regardless of the purposes which were in the minds of the instigators of such a valuation, in my opinion it will result in a benefit to the railroads and, through them, even to the water interests. Among the results which will be accepted as facts, it will surprise me if it is not found that at least 30 per cent of the capital of the trunk lines is invested in terminals in cities having water transportation, and possibly 50 per cent or more of their capital in what may properly be termed terminals of all kinds in all cities. This subdivision of the capitalization of the railroads alone will give you an idea of the problems which confront the railroads, and also, the port authorities, for part of their problems are your problems.

The railroad system may be likened unto a tree, with rootlets and leaves and branchlets being the necessary terminals for collection and distribution of the elements which pass up and down the trunk and larger branches of the tree, the branchlets and rootlets costing 50 per cent of the entire capitalization, and the branchlets and rootlets, when once built, are fixtures, immovable and without flexibility.

It is for this reason, among others, that I am unable to satisfy my mind that there is any outstanding rational method so far advanced for basing rate regulation on the cost of haul of any one commodity between any particular localities on a large system.

The rate is based on the haul, on the portion of the length of the trunk and main branches used, the entire length of which represents 50 per cent of the capital cost of the investment, and is subject to control of commissions, whose rulings are subject only to the application of a court test of confiscation of its individual rulings and, so far, no court test of its collective rulings which, after all, should be the final test, and the results of which are burdening and, from the facts submitted, in my opinion, unnecessarily retarding the growth of this great transportation agency and the country.

Referring particularly to the railroad situation at a large seaport. Such a city usually has four distinct districts of utility; first, the waterfront, second, the industrial district, third, the business district and fourth, the residential district, through all of which zones the railroads have to buy a right of way to even reach the waterfront and, having reached it, in addition to lighterage and floating equipment, piers have to be constructed at their own expense which are suitable to the particular kind of business which they carry on, with special loading and unloading facilities, and which become obsolete as soon as the character of the business changes. Owing to its obligations to the industrial interests which have located along its lines through the city it is practically impossible to abandon such a line, or a portion of it, even if the growth of the city and municipal demands for grade crossing elimination or other city improvements, which such a line is universally subject to, makes the investment so great that the business is unprofitable and a burden to the railroad. As to a railroad company building along a waterfront, even where needed and the financial returns on present cost make it possible, it has been made so difficult by the municipal authorities, and has such possibilities of unlimited burdens being placed on the investment, that such building has practically ceased.

In my opinion, if it had not been for the financial aspect brought on by various causes, which has slowed down advancement and progress in this country the railroads, at the present time, would be unable to handle economically, or at least expeditiously, if at all, all the business which would be offering. Unless rail transportation interests are encouraged by being allowed to earn attractive returns on their present investment as a surety of further returns on the additional capital needed to keep its facilities in pace with our growth, they will not be able to handle the normal expansion of our commercial interests in the United States, particularly at their terminals and ports.

The past history of our ports in a general way, to date, has been that private individuals or corporations have been forced to buy their waterfront, build their piers as opportunity offered and finances permitted, on the prospect of securing a profitable business; in other words, taking the business risk and it is only recently that, to any extent, municipal authorities have begun to formulate plans, or to expend money in carrying out such plans, or to provide more efficient facilities on the waterfront and, so far as I know, even such action has confined itself to buying out going concerns, remodeling and re-renting, and there has been no municipal action which involves the creation of port facilities on undeveloped property, or which approaches in any way the business risk or initiative which has been taken by private individuals or corporations.

To summarize, I have tried briefly to show the community of interests of water and rail transportation; the business handled; the method of handling required; a rational preference of location based on the business handled; the physical and financial requirements under which these interests operate and the influences which affect the rate; that the railroads cannot proceed with the developments of the ports in the future as in the past; that there is a demand for increasing facilities at the cities and their ports to keep pace with the growth of the country; and that municipal development so far has been inconsequential in proportion to the interests involved.

What is the remedy? What can the port authorities do to help the situation? A city should be developed with a due relationship to all its units, of which the port is only one; waterfront property possesses value and gives returns to the community to the extent that it is properly utilized through intelligent supervision,—ownership will permit of such supervision.

Excepting piers for bulk trans-shipment, it is my opinion that piers in cities of a certain class should be publicly owned so that the assignment of piers to private or corporate interests can be decided on the most efficient basis for the necessities of the city, that a belt line should connect a large part of these piers with the industrial zones which grow up around the city.

The problem, however, is not the actual building of the piers or of the belt line, or the money involved, but it is to find a policy to carry out such plans which will not reduce the value of the millions which private and corporate interests have taken in business risks in developing the growth of the city in the past, or, in other words, to punish them for having been a factor in such growth. This is the one great problem of the port authorities of America and the one which should receive your most serious thought, and if you can work out a method of settling this problem with fairness and equity, you will receive the support of all the factors which go to increase the growth of your city. It has so many angles that it would be too lengthy a subject for me to discuss on such an occasion.

There is one other thought which I would like to express to you from a railroad man's point of view. We often hear and read statements that the railroads of most cities have attempted to dominate the waterfront, to limit competition by water carriage, that they oppose the Panama Canal, that they fight the improvements of canals or river improvements, and so on. To my mind, this is the expression of a man with paucity of ideas who builds a house of cards to knock down. From the very nature of things any improvement of our transportation facilities of any kind whatever, water, electric lines, trolleys, motors, improvement of our rivers, etc., cannot but help but increase inherently the amount of rail transportation.

It may be that there may have been criticism of the economic aspect of Government assistance to water interests, that the amount of business encouraged did not compensate for the cost, but in my opinion, any antagonism or criticism of any such undertakings, per se, does not represent the mental attitude of the men who are the brawn, sinew and brains of the railroad interests.

The purposes of your Association are entitled to support. Any relief of congestion in the cities which the port authorities can bring about should be welcomed and assisted in any way possible, and I wish you a full measure of success.

Moving the Kansas Wheat Crop

By A. DeBernardi

General Superintendent, Western District, Missouri Pacific Railway.

Note:—The following article appears in a recent issue of the "Agents' Bulletin" published by the Missouri Pacific. As the Kansas wheat crop for 1914 was almost double that of the greatest previous year, the manner in which it was handled by the great transportation interests of that state is of more than usual interest. The article very clearly emphasizes the importance of the railroad to the farming community and the difficulty of the transportation problems facing the carriers in promptly handling our enormous crops.

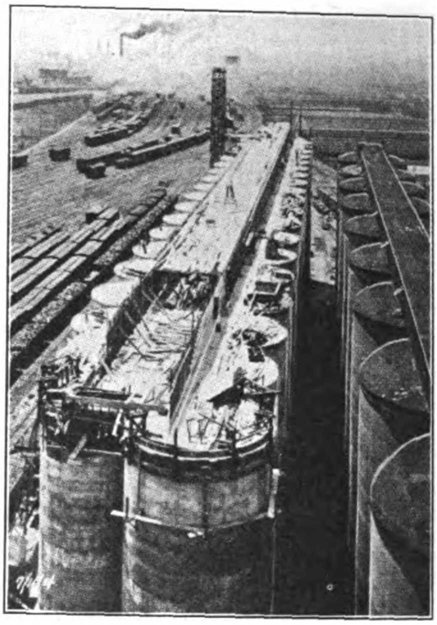
THE Missouri Pacific Railway operates 2,384 miles in Kansas, all but 204 miles of which forms a part of the Western District. It will be seen by reference to the accompanying map that our line lies tributary to almost every important wheat-raising county in the State.

Following almost a total corn failure in Kansas in 1913, a large majority of the farmers turned their attention to the sowing of winter wheat, consequently the acreage was unusually large. After a most favorable fall and winter, it became apparent early the past spring that producers, as well as the carriers and elevators, would be called upon to handle the most gigantic wheat crop in the history of this section. Then all concerned at once proceeded to prepare for the task. The most optimistic did not however realize the magnitude of the crop.

The railroads, early in May, began to repair their engines and cars. Cars were assembled on every available siding in the wheat belt, until, it is estimated, there were 30,000 awaiting the movement. Harvesting machines of all kinds could be seen in almost every freight train, and the call for labor which had been advertised to the four boundaries of the United States was followed by a tide of immigration 50,000 strong. Farm laborers utilized the space in all passenger-carrying trains, while the less fortunate among them became a menace and nuisance to the freight trainmen by riding in and upon freight cars. Many tramped upon the railroads and highways. Numerous college men and high school boys, who were attracted by the high wages offered, were unable to endure the intense heat of the Kansas sun. A large number were without funds, so it was necessary for the people of Kansas to provide means for keeping them until their services would be required in the wheat fields. One small town on our line kept one thousand men for three weeks, turning over to them the City Park, where they retired at night upon "Nature's Sleeping Porch" and devoured "three squares" a day at the expense of the city.

In some instances farmers came to hire the men in person, while in others the merchants, with whom they traded, selected the men and assigned them to the fields where labor was plentiful. Wages varied from $2.50 to $5.00 per day, the higher rate being paid for stackers.

When harvesting commenced, somewhat earlier than usual on account of the favorable season, we were anxious, as were our officers at headquarters, as to the extent of this already famous crop. When our agents in some of the large producing counties advised that threshing was in progress and wheat yielding thirty to thirty-five bushels to the acre, we asked for confirmation of these reports only to find that in many cases the yield was even larger than stated. It is now a matter of record that the State as a whole has produced an average of 20.3 bushels to the acre.



Top View of Kansas-Missouri Company's Grain Elevator Nearing Completion.

This elevator contains fifty large round bins and nineteen interstices; or bins between the large round ones.

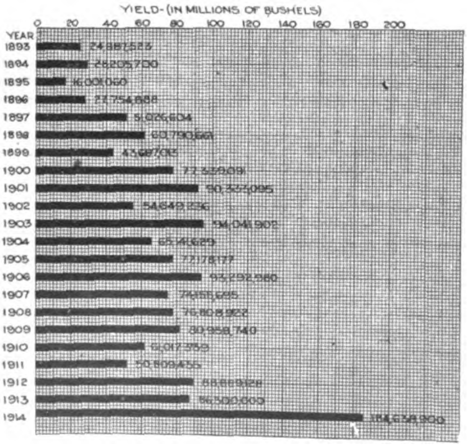


Chart Showing the Wheat Yield of Kansas for a Series of Twenty-two Years.

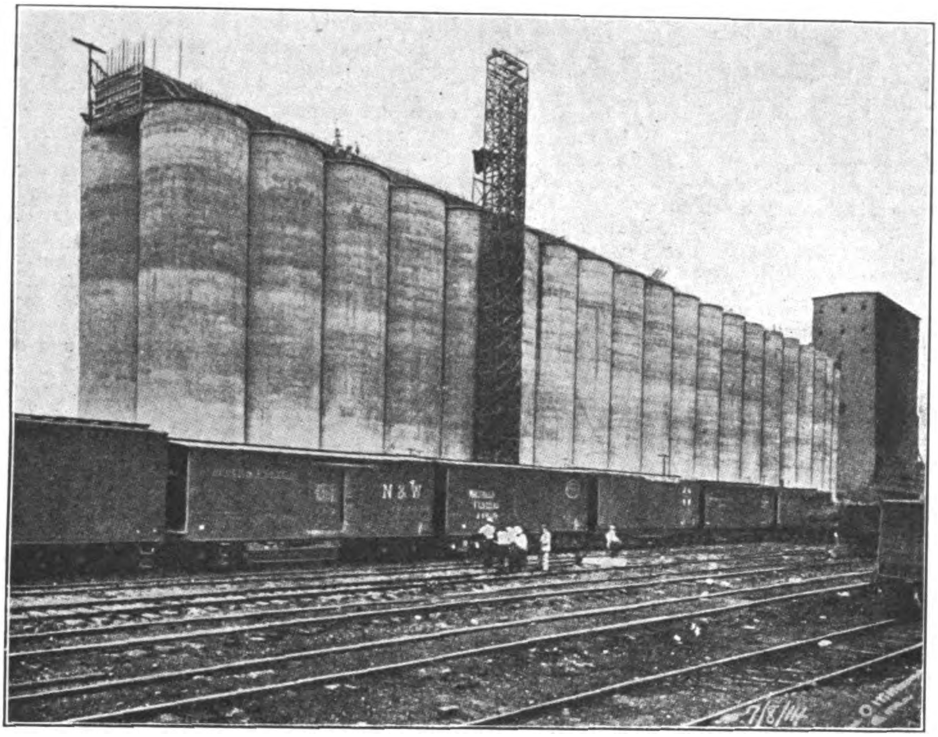
The map referred to shows the acreage and estimated yield in each county, and those familiar with the State of Kansas will, no doubt, be surprised to know every county in the State produced some wheat even the western tier, known as the "Short Grass Country."

For comparison I am giving below the wheat yield in bushels in Kansas for twenty-two years, from which it will be seen the estimated crop this year is almost double that of the greatest previous year, 1903.

The estimated crop this year would fill 184,639 cars of one thousand bushels each, and make a train one thousand four hundred and eighty miles long, requiring six thousand engines to move it. This train would reach from Salt Lake, Utah, to St. Louis, Mo. Running ten miles per hour, it would require more than six days to pass a given station.

In the eastern part of Kansas, harvesting is done principally with binders, which cut the wheat close to the ground, and tie it into bundles. The machines are followed by a sufficient number of men to place the cuttings into shocks of about twelve sheaves each. In the western part of the State, grain is cut with headers, which take heads and only sufficient straw to insure getting all the wheat, leaving the larger part of the straw standing. The header is accompanied by wagons equipped with large boxes,



ANOTHER VIEW OF THE KANSAS-MISSOURI COMPANY'S NEW ELEVATOR.

Located on the Missouri Pacific tracks at Kansas City, Mo. Total capacity 2,173,000 bushels. Construction, Monolithic. Handles 20,000 bushels per hour.

called "barges" for catching the wheat as it comes from the header.

If the market is favorable, the grain is generally threshed from the shock as fast as possible. This year, on account of the immense crop, threshing could not be done promptly and a large amount of the grain was stacked. Threshing closely follows harvesting, and is usually done by contract, threshers hauling bundles of wheat from the field to the machines and farmers hauling it from the machines to bins or shipping points. These contract outfits consist of engine, separator, cook-wagon, and crew to operate. The charge for threshing varies somewhat, the average being about eight cents per bushel. Wheat is hauled to the market in bulk by wagons, the carrying capacity of which is about sixty bushels.

The cost of production and delivery to the railroad is estimated at about 53 cents per bushel.

The crop, even at 70 cents per bushel, would yield to the producers approximately $129,245,200—a strong argument in favor of the "Back-to-the-Farm" movement.

At each station will be found one or more elevators equipped to handle from one thousand to ten thousand bushels per day, and with a storage capacity twice as great. Wheat is usually sold to dealers located at elevators, who test the grain for weight, moisture, etc. Adjacent to the elevator is a scale on which the grain is weighed. It is then dumped from the wagon into a pit, from which it is elevated by power of gasoline engine and deposited in the elevator bin. After that, it passes out through a spout to a car on an adjoining track. There are eleven hundred of these elevators in Kansas.

The movement of wheat depends upon prices. Competition is very sharp and the local elevator operator must receive quick advice of every fluctuation in the market. At the close of this harvest, wheat was commanding a fair price consequently it began to move rapidly there being as much as two million bushels in transit in one day on the various railroads of the State. The market soon slumped, however, owing to the enormous yield. The first advice of the European war caused another sharp advance and increased deliveries, which continued until the ports became congested and finally blocked on account of the heavy movement and the lack of shipping facilities caused by the strife. This stopped all loading and movement, except to the flour mills and storage elevators.

The question uppermost in the minds of railroad and business men is: What has become of all the wheat? From the best figures we are able to obtain, only about twenty-five per cent of the crop has moved from the producing sections. The remaining seventy-five per cent is stored in private elevators, granaries and bins, with a large percentage stacked and not yet threshed. One Kansas City manufacturer this year sold sufficient bins to store five million bushels. These metal bins can be seen in the fields in all parts of the State. Wheat is also stored in silos or in bins in the fields, covered with tarpaulins, and sometimes even in the attic or on the floor in the guest's bed-room of the farmhouse.

It is estimated by the Agricultural Department of the State that about nine million bushels will be used for seed and fifty million bushels milled by the 500 mills of Kansas, leaving about eighty million, almost equal to any previous year's crop, yet to be moved out of the State. This, in my opinion, will move more gradually in the future, dependent largely upon the duration and result of the European war. Many grain men, including farmers, believe wheat will be worth $1.25 per bushel next Spring if the war continues. They will hold a great deal of their grain for this anticipated advance, which, I believe, will be of great benefit to the carriers, as it will largely overcome the much-dreaded car famine.

The Kansas farmers have become imbued with the spirit of "Safety First," and most of them have provided themselves with storage capacity, the wisdom of experience having taught them that to congest the market inevitably means to lower the price of their product. Wichita, Coffeyville and other large cities of the State are equipped with modern elevators, and at Kansas City the total capacity of all elevators is about seventeen million bushels. The accompanying cut shows one of the largest and most modern. It is located on the Missouri Pacific Railway at Kansas City, and, with additions just completed, has a capacity of 2,137,000 bushels.

It may not be out of place to mention here the railroads' part in the movement of this crop. It consists of hauling empty cars many hundreds of miles, at heavy expense, so they may be available where and when needed. The transportation companies must pay per diem or car hire for those owned by other roads. They must also switch cars to the elevators for loading, move them from the elevators and switch them into trains, furnishing motive power and trainmen to move the entire distance from the point of shipment to destination, including the passing through various yards where cars must be rehandled and inspected. At destination, Kansas City for example, the cars are switched upon special tracks for inspection by representatives of the State and Board of Trade, and are then hauled to an elevator, or other designated point, or taken into the train yard for re-consignment and forwarding.

The shippers and elevator people, realizing the delay to car equipment in its ordinary movement, I am pleased to say, have co-operated with the railroads and assisted us materially in keeping cars moving, **which is the best known cure for car shortage.**

We have also made clear the necessity for loading cars to their full physical carrying capacity. There is a gain of the use of one car in every ten cars so loaded, which in the movement of this crop would mean a total gain of 18,460 cars.

Wood Frame Cars in Freight Trains of To-Day

By G. E. Smart

Master Car Builder, Intercolonial Railway.

A FEW years ago the thirty ton all-wood freight car was considered standard, but since the introduction of steel in car building it has replaced wood and to-day we have all steel coal cars, all steel box cars, lined with wood inside, and steel underframe cars, of all classes of 40 and 50 tons, and a few of 75 tons capacity.

There are a large number of wooden underframe cars still in service, and the question in regard to these is: "What can be done to make this class of car safe to be handled in the long trains and meet the severe usage that they receive in yard switching service to-day?"

The draft gear problem is certainly the most important. The annual cost of repairs to cars that are damaged through the draft gear failure, and loss and damage claims resulting therefrom exceed all other repairs made to freight car equipment. The question naturally arises: "What are the causes of these failures?"

They are as follows:—

First. On account of introduction of heavier power and longer trains.

Second. Placing of light and heavy cars together in trains.

Third. Rough switching of cars in yard.

With regard to the first and second causes:

The tractive power of locomotives has increased during the last few years from 20,000 lbs., known as the 100 per cent engines to about 45,000 lbs., or 225 per cent for locomotives in general use in Canada, and the 2-10-2 type used on American roads to 84,000 lbs., and in addition to this type there are in use on certain sections of the country, locomotives of the Mallet type, with tractive power of 110,000 to 120,000 lbs., and, notwithstanding this enormous increase, there is a type of locomotive just placed in service, known as the Erie Triplex, with a tractive power of 160,000 lbs., with a haulage capacity equivalent to a train consisting of 250 fully loaded cars each of 50 tons capacity, 1.6 miles in length and a total weight of 18,000 tons. On comparing trains of the present day with those of a few years ago, the average number of cars hauled being 25, or approximately 1,000 feet long. To-day the ordinary trains are 60 to 100 cars, and a train of 100 cars would be approximately 4,000 feet, or about ¾ of a mile long.

What chance has a wood frame car under the conditions as they exist to-day on the front end of such a train? In my opinion it is a very good reason why cars of this class are so often found on repair tracks, if a car of this type was to be traced from the time it leaves the terminal it would be found that it was necessary to remove parts of the load quite often, which beside the expense of repairs results in delay to freight en route, and it is the fruitful cause for so many claims on account of damage to freight handling in and out of the car.

The solution of the problem is not altogether the physical characteristics of the car or entirely

Foot Note:—From an address delivered before the Canadian Railway Club, on Oct. 13, 1914.

mechanical. The operating official should co-operate with the Mechanical Department in reducing the freight car repairs by arranging as far as possible that cars with all steel construction or with steel underframe, or those with steel centre sills be placed in the front end of the trains. It is a fact that we find light capacity cars with wood underframe or empty flat cars leaving the terminal on the head end of one of the long trains. And in the majority of cases the cars are billed through and will not be set off between terminal points, unless set off on account of draft gear failure. This, no doubt, could have been avoided had the cars been placed towards the rear of the train before leaving the terminal.

There are railways who recognize the necessity of placing weak cars toward the rear of the train, and they provide cards stating that they must not be placed more than fifteen cars from the caboose. This indicates that the car is in such a condition that it must be so located in the train, but is safe in ordinary service to be hauled to destination, and if this is done delay and extra switching on account of draft gear failure along the line would be eliminated, and it would not be necessary to move the lading on account of this feature.

The third cause: "Rough switching in yard, is a great factor in car repairs."

The speed limit for switching in yards is nil, nor are there any rules in force governing the speed of locomotives in switching service.

If you were to confer with the Car Inspectors and obtain their opinion as to where most damage is done to cars, I am safe in saying that their answer would be in the switching yards, as their daily experience in inspecting cars immediately on arrival and after they have been switched in yard will confirm this. This is only a small item as compared with actual damage started in yard and which through the cars being necessarily weakened thereby, is aggravated after leaving terminals, and results in many cases in the cars breaking down before reaching destination.

A visit to the freight car yard will convince you that it is just a question how fast the cars can be switched together, the speed that the cars are traveling is not considered, hence cars are found buckled up in yards and the draft gear lying around, same having been pulled out due to rough switching.

There should be some speed limit in yards to prevent this destruction of equipment. The time lost in switching out bad order cars damaged in yard and taking same to repair track would often offset the time gained by excessive speed that cars are switched together. The cost of repairing these cars must also be considered, and the thousands of dollars of damage done to the contents of cars in yard that are not set off for repairs.

What is the Mechanical Department doing to-day to overcome these troubles?

First. They are building steel frame cars to certain specifications with stronger types of draft gear.

Second. Applying steel underframe or steel centre sills and steel ends, or otherwise re-inforcing the ends of cars to withstand the heavy shock.

Third. Applying different types of steel draft arms to the present wood centre sills in such a manner that it re-inforces the wood centre sills, thus greatly reducing the cost of strengthening up the draft gear.

Fourth. Applying heavier types of couplers and draft gear, and using friction draft gear, for in the past very little attention has been paid to what type of draft gear the cars were equipped with, but the friction type of draft gear is now being used to a large extent.

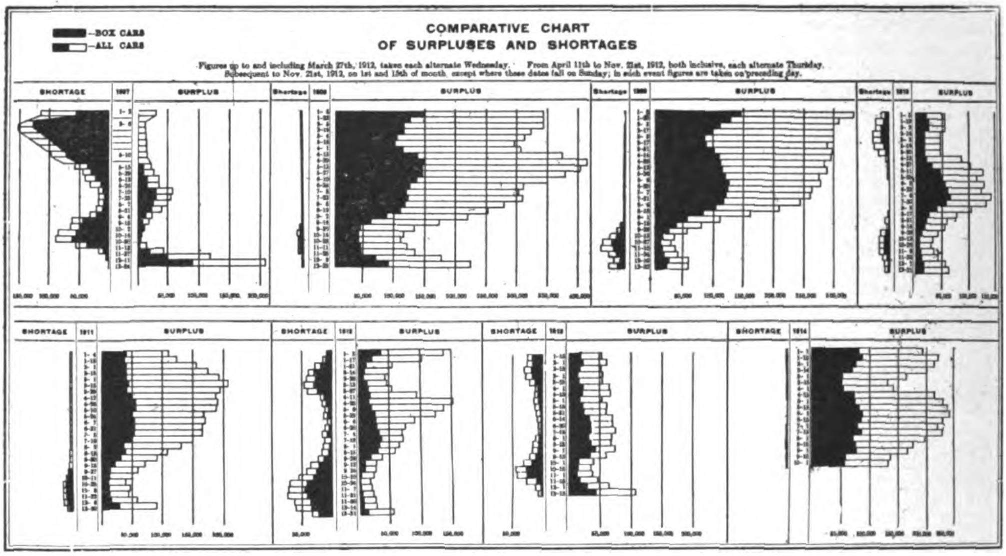
The demands of modern railroading requires the stopping of a high speed train in about two minutes and the draft gear is expected to absorb the shock. The Air Brake Department can help to eliminate the strain on the draft gear by instructing the engineers as to the proper method of handling the long trains. The principal thing is to control the slack to prevent it from running in or out harshly. Slack in draft gear cannot be prevented as it is due to compression of the springs, and the heavier the locomotive and the longer the train, the greater the care that is required. Engineers are instructed in the air brake construction car how this should be done, but the general air brake inspector should see to it that the rules are followed out in actual service.

The vital question to-day before the Car Department is how to keep these wood underframe cars in service. The majority of the railroads are destroying the 40,000 lb. cars, but the 60,000 lb. and 80,000 lb. cars that were built with wood underframe and short draft timbers are not any stronger and cannot withstand the heavy service and severe yard conditions of to-day, and unless the Operating Department will assist in reducing the damage done to cars and thus reduce freight car repairs, and also keep the cars in service by marshalling this class of car on the rear end of the train, and exercising greater care in switching cars in yard, the cost of freight car repairs will increase and the repair tracks will be full of bad order cars. The only other remedy is to spend money to apply steel centre sills or steel draft arms, so arranged as to strengthen the present wood centre sills, and in addition to this re-inforce the end of this class of cars. But yet the strongest car built cannot withstand the severe usage received in yard switching operations of to-day unless more care is exercised on the part of the yard crews.

Operation

Latest Report on Car Situation.

THE latest report of the American Railway Association shows that the total number of idle cars on October 1, 1914, was 133,383 against 138,108 on September 15, 1914 and 41,994 on October 1, 1913. While there has been a steady decline in surplus equipment since the first of July, it has not been nearly so rapid as during 1913, as the latest comparative figures indicate. At the present time there are approximately 100,000 more cars idle than there



was on the corresponding date of last year. It is reported that the reduction in surplus cars is about equally divided between box, coal and miscellaneous cars, there being little change in the flat car surplus. Generally, unsatisfactory traffic conditions are reflected in the fact that not during the past decade has the number of idle cars for October been so large as it is at the present time.

New Commissary of the Southern Pacific at Los Angeles.

THE Southern Pacific Company has just completed at Los Angeles, one of the most remarkable commissaries in the world. It is dust-proof and fly-proof. The sun can never touch the perishables. Provisions are weighed, iced, sorted and issued without once having been touched by human hand. Liquids are delivered in sealed glass containers and cream is moved in gallon tins that, once used are thrown away, thus insuring dining car patrons a product free from contamination. It boasts a humidor, measuring ten by four feet with a capacity of 40,000 cigars. And in its sanitary protection, there is even provided a special concrete-lined refuse room, where garbage, pending incineration, is immediately placed under refrigeration.

ALLAN POLLOK.

Superintendent of dining cars, hotels and restaurants, Southern Pacific Company.

One hundred thousand dollars went into this commissary, which is located two blocks south of the Arcade depot. The center of the building is one story in height, the south end, two stories. Covered platforms surround the entire structure. They are provided with water, compressed air and steam—the three big factors in preserving the spotlessness of the place. At the rear, are five tracks whereon the dining cars, returning at the end of each trip, are cleaned, scoured and scrubbed. Water, steam and compressed air, with which the tracks are equipped, are used in giving the big cars their baths, and lest any dust escape to the platforms, vacuum cleaners are used.

As soon as the diners arrive, they are at once placed on these tracks and inspected before the crews leave. Perishables are removed, ice boxes and lockers thoroughly cleansed, and all kitchen utensils, such as coffee urns and filters, are taken away to be sterilized.

The general plan is so arranged that commodities move always in one direction from receipt to delivery. The issue of supplies from this commissary alone, aggregates between $40,000 and $50,000 in purchases a month. And this figure applies only to the southern district, which extends from Los Angeles north to Fresno and Santa Barbara, and south as far as New Orleans.

All purchases are made locally, where possible, this being in line with the company's policy. In this connection, the company always aims to furnish the first products of the season, especially fruits. Southern Pacific diners yearly carry the first canteloupes from Imperial Valley, the first figs from India, etc.

Combined with the big kitchen, which is di-

rected by Mons. Doriel, a widely known chef, there is a cooking school where the dining car cooks are given a chance to show their individuality in the final preparation and serving of stock materials. Meats go from the butcher shop to big refrigerators, and when required, go to the diners in especially constructed, highly aluminized and covered trucks. The grocery room, refrigerators, linen rooms, main offices and assembly rooms for the crews all boast unique features.

The exterior of the building is thoroughly in keeping with the interior in sanitation and cleanliness, the moral effect of cleanliness on the crews not having been overlooked by Superintendent Allan Pollok, of the dining car, hotel

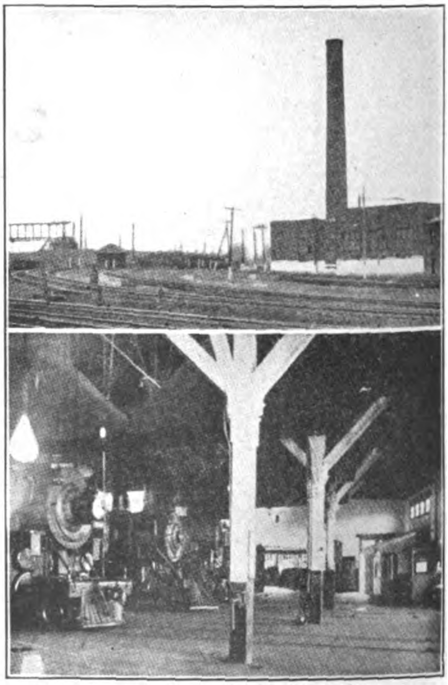
and restaurant department. Working in an atmosphere of cleanliness, they naturally maintain a higher standard of carefulness themselves.

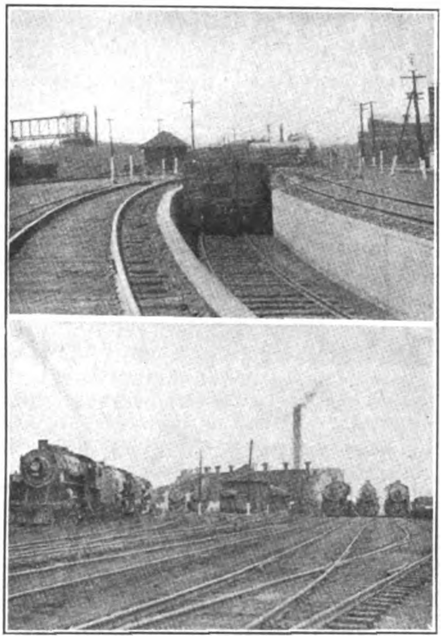
A Model Round House.

ONE of the most striking illustrations of what can be done in the interests of safety and efficiency may be observed by an inspection of the roundhouse at East Syracuse, N. Y., on the New York Central. This roundhouse, situated on the main trunk line of the road, and adjacent to one of the large yards of the system, is naturally a busy place. There are from 115 to 150 engines handled there daily. But in spite of this fact, the entire plant is a model of cleanliness, order and safeness. The plant is in charge of F. J. Wiegand, General Foreman.

A person visiting this plant is at once impressed with the order and cleanliness that prevails. The roundhouse floors, shop floors and the grounds surrounding the roundhouse and other buildings are all kept clean and you do not see any material, tools or articles of any kind lying about that a person might stumble over. Neatness is the feature throughout. Safety First signs are conspicuously stenciled about the place, but the Safety First idea is in evidence not alone in these signs, but in every day practice as well. For instance: There is a man in charge of the tool room, who is held responsible for the condition of all hand tools, jacks, ladders, etc. His duty is to inspect all tools once a week, taking any that are defective, such as hammers and chisels with burred heads, out of service and not allowing them to be used again until they have been put in proper condition. Goggles are supplied to all men engaged in chipping and grinding and they are required to sign a book each morning before they start to work, stating they have the goggles in their possession. In the Machine Shop all machines are well guarded and employes are not allowed to operate a machine with their clothing in a loose or baggy condition. All manholes and clearances are properly protected and floors, walkways, etc., are kept in fine repair, there being no holes or obstructions of any kind in evidence. Alongside of the ash pits are racks erected for the purpose of holding rakes, slash bars and shaker levers and strict attention is paid to keeping the tools in this rack when not in actual use. The electrically operated turn-



Upper Picture Shows General Neat Appearance of East Syracuse Plant. Lower Picture is an Interior View of East Syracuse Engine House. No Loose Material Lying on Floor.



Upper Picture Shows Stop Signals for Track Leading to Turntable. Lower Picture Indicates Some of the Power Handled at East Syracuse. Clean Condition of Ground is Particularly Noticeable.

table has starting switches enclosed with proper guard and there is a standard railing on table. Turntable stop signals are erected forty feet from the turntable and no engine is allowed to pass these signals and go onto the table until a full stop is made and signal to proceed given by turntable operator.

Alongside of the old roundhouse a new modern house has been erected containing the most modern system of lighting, heating and ventilating. However, one is impressed with the fact that even the old roundhouse looks as clean, neat and free from unsafe conditions as the new and modern house next to it.

The outer wall of the roundhouse for a distance of several feet from the ground has been whitewashed, which adds to the general neat appearance.

Safety Developments on the Santa Fe.

THE Safety Commissioner of the Atchison, Topeka and Santa Fe Railway System, Isaiah Hale, has recently prepared a comparative statement showing the number of personal injuries to employes of that system during the fiscal years ending June 30, 1913 and 1914. In brief, this statement shows a reduction of accidents in practically every branch of the service, the total number injured for 1914 being 12,107 as against 13,421 for 1913, a difference in favor of the greater safety movement of 1,314. The reduction in the number killed by a similar comparison was 37, the total number of employes meeting death in 1914 being 66 and in 1913, 103.

In connection with this reduction it should also be noted that during the last fiscal year, a number of minor injuries were reported and recorded, of which in former years, no record was made, so that, as a matter of fact, the beneficial results of the Santa Fe safety campaign have been even greater than the comparative statement indicates.

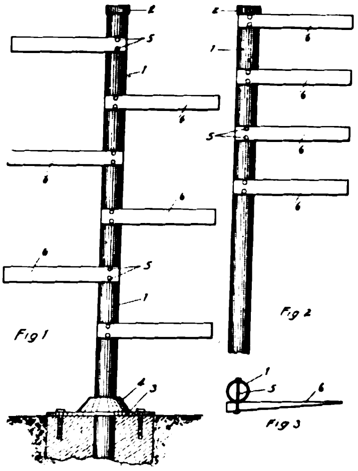
According to Mr. Hale, the work now ahead of the Safety Bureau, is to make employes realize that the final analysis shows that the real gainer is not the railway but the individual employe. While, according to the figures quoted, the Santa Fe has an additional 37 loyal employes which might not have been living, the greater benefit rests in the fact that the same number of mothers still have their sons, wives their husbands, and probably several times that number of children still have their fathers. In this result the safety movement ranks among the greatest humanitarian efforts of the age.

Southern Pacific Conductor Invents New Safety Device.

CONDUCTOR WILLIAM SCHWAB, of the Sacramento Division of the Southern Pacific, to whom was awarded the bronze, or employe's medal, replica of the Harriman Memorial Gold Medal, last year bestowed by the American Society of Museum upon the Southern Pacific System for its splendid record in accident prevention, has invented a new railroad safety device, which is to be exhibited by the Museum.

The device is a side-clearance "tell-tale" for the purpose of warning railway employes riding on side ladders of box cars or on steps of coaches of dangerous obstructions ahead of the train in time to avoid being injured thereby.

It consists of a pole erected on the side of the main track, between double railroad tracks or between main tracks and sidings, and having several horizontal flexible arms extending toward the track. While giving trainmen warning by striking their persons, the flexible arms of the "tell-tale" do not injure or bruise them in any way. A single form having arms extended from one side only is used when the device is to be placed only alongside the main track.



Side-clearance "Tell-tale" Device Invented by Southern Pacific Railway Conductor.

Pennsylvania Railroad Awards Prizes for Roadbed Maintenance.

THE Pennsylvania Railroad has awarded $5,400 in premiums for the maintenance of sections of roadbed in the best condition during the past year. The Special Committee making the awards consisted of W. G. Coughlin, engineer of maintenance of way, chairman; A. B. Clark, assistant engineer of maintenance of way, in charge of roadway and track; J. J. Rhoads, superintendent of the Media Division, and N. J. Cleave, superintendent of the Cresson Division.

The first premium, that of $1200, of which $800 goes to the supervisor and $400 to the assistant supervisor having the best line and surface between New York and Pittsburgh and Philadelphia and Washington, was awarded to C. M. Wisman, supervisor and H. M. Grimm, assistant supervisor, who have charge of the track between Tullytown, Pa., and Deans, N. J. The other prizes were:

Four premiums of $800 each—$600 for the supervisor and $200 for the assistant for the best line and surface on a main line superintendent's division between New York and Pittsburgh and Philadelphia and Washington, awarded as follows:

C. Z. Moore, supervisor, C. L. P. Russell, assistant supervisor, in charge of track between Dillerville and Harrisburg, Pa.

W. T. Hanly, supervisor, J. B. Baker, assistant supervisor, in charge of track from west of Rockville Bridge to Thompsontown, Pa.

W. S. Wilson, supervisor, C. W. Barwis, assistant supervisor, in charge of track between Altoona and Portage, Pa., including the "Horse Shoe Curve."

G. H. B. English, supervisor, C. M. Hurah, assistant supervisor, in charge of track between Wilmington, Del., and Perryville, Md.

A special improvement premium of $1000—$700 to the supervisor and $300 to the assistant, for the greatest improvement made in line and surface on the main line between New York and Pittsburgh and Philadelphia and Washington, was awarded to A. W. McClellan, former supervisor and assistant supervisor H. L. Pierce, for the section of track between Donohoe and Wilmerding, Pa.

Norfolk and Western's Safety Leaflet to Employes.

THE Norfolk and Western has recently had prepared a safety leaflet for general distribution among its employes under the caption "Remember it is Better to be Careful than to be Crippled." The full statement contained in the leaflet is as follows:

During the year 1913, more than four thousand five hundred employes of our line were killed and injured.

Consider this statement carefully and then ask yourself squarely, the question: Who should be most interested in the prevention of accidents? There can be but one reply: The Men of the Norfolk and Western.

Accidents can, in a great measure, be prevented, and the figures shown above give you the strongest reason to interest yourselves, individually, in the work of prevention. You alone cannot produce the desired result, nor can the Company do so without your support. You can see that the problem must be faced together—that the men and the Company must earnestly and heartily, shoulder to shoulder, work in unison for the preservation of life and limb to employes and efficiency to the Company. For its part, the Management is willing to spend money to correct dangerous conditions and asks you for your part to try to correct dangerous practices and eliminate the taking of risk. The Company wishes you to take its time to do a thing safely, rather than to save its time and take a risk.

The results following these injuries have been:

To the Company: A substantial loss, both in money and efficiency, because whenever an experienced man is killed or injured a green man must be employed who in many cases, while getting his experience, delays work, breaks up equipment and perhaps kills himself or someone else.

To the Men Injured: Pain, loss of wages and perhaps poverty, and life as a cripple.

To the Families of Those Killed: Sorrow at the death of husband and father, distress and perhaps want because of the loss of his earnings.

A little serious thought will convince you that while the Company loses, the burden falls heaviest upon you.

If neither the pain, the distress, nor the cost in money and efficiency appeal to you, perhaps your interest may be aroused by the suggestion that, without accident prevention, you may be the next one—that your children may soon be fatherless and your wife a widow.

Can you afford not to join the Company heartily in its effort to reduce this useless loss of life and limb?

Warning to Passengers.

PEOPLE who insist on standing on the platforms of moving passenger cars place in jeopardy their own lives and the lives of others.

It is the intention of the Pennsylvania Railroad to put a stop to this practice if it is possible. The officers of the Pennsylvania Railroad have even gone to the point of writing a letter to the general managers and superintendents of the various industries around Pittsburgh, requesting them to post notices in their factories, warning employes of the danger of standing on the platforms of moving cars.

The following general notice to passenger trainmen has been posted on the bulletin boards of the Pittsburgh Division:

"Your attention is called to the fact that concerted effort on the part of every trainman is necessary, at once, to keep passengers from riding on platforms or steps of cars between or approaching stations.

"A letter has been sent to all industries, requesting that all employes be warned of the danger and of violations of the rules for safety, by riding on platforms.

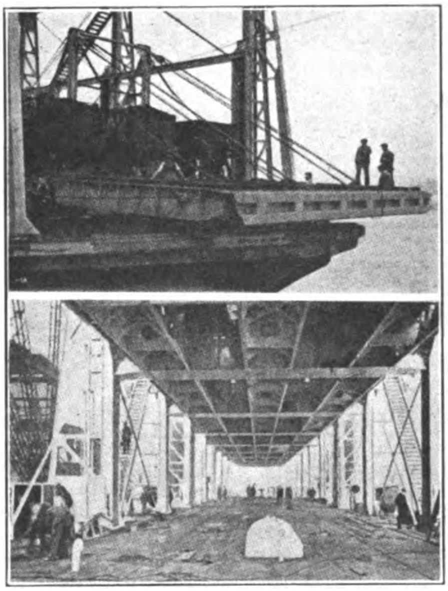
"This practice, now common, will be broken up by concerted action alone. If, in any case, assistance in enforcing the rule is desired, you will report to this office at once."

Mechanical

A Railway Car Ferry of Novel Construction.

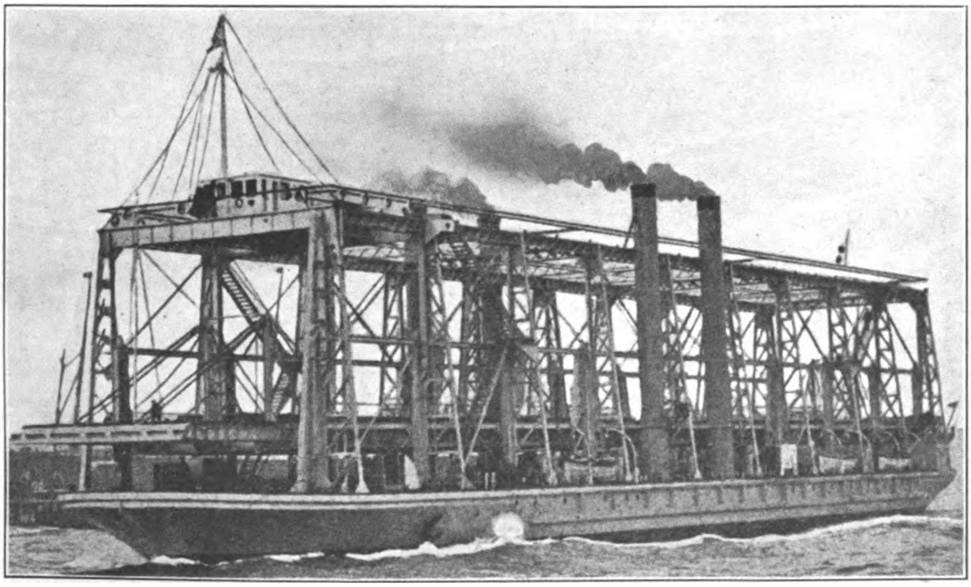
THE accompanying illustrations, for which we are indebted to the "Canadian Railway and Marine World," present a general idea of the new car ferry of the National Transcontinental Railway which is to be employed for conveying trains across the St. Lawrence River, pending the completion of the Quebec bridge. The boat is designed for transporting standard passenger and freight trains across the river at all seasons of the year. The average weight of the trains is estimated at 1,285 tons and the time consumed in making the trip, including both transfers, is about three-quarters of an hour. The river at this point is two and one-half miles wide.

To meet the unusual conditions, several practically new ideas were embodied in the construction of this vessel, which is not only generally strengthened for service in ice but is also equipped with an ice breaking propeller besides twin screws for ordinary propulsion purposes.



UPPER PHOTOGRAPH PICTURES ADJUSTABLE HINGED APRON CONNECTED TO TIDAL DECK BY BALL AND SOCKET JOINTS, WHILE LOWER PHOTOGRAPH IS A VIEW OF MAIN DECK SHOWING TIDAL DECK ABOVE IN ITS RAISED POSITIONS.

The special feature of the design, however, is the movable tidal car deck. As the railway tracks on either side of the river are at a fixed level, the boat, as the illustration indicates, has been equipped with a tidal deck able to take the cars from the fixed track at any stage of the tide, the range being eighteen feet. Ten transverse girders support the deck and each rests on a large nut which works up and down on a vertical screw, giving the deck the necessary range of action. The deck contains three lengths of track each 272 feet long and at each end is an adjustable hinged gangway suspended by means of treble purchases from struts fixed on the deck. These gangways are arranged with ball and socket joints at the ends of each of the girders carrying the rails, to allow for any heel of vessel or change of trim which takes place when loading or unloading the cars. The tidal deck lifting screws are hung from ball bearings supported on strong columns, which in turn are stayed by lattice buttresses against fore and aft and transverse thrusts, while below the main deck a specially strong braced



GENERAL VIEW OF NATIONAL TRANSCONTINENTAL RAILWAY CAR FERRY WITH ADJUSTABLE TIDAL DECK PARTIALLY RAISED.

strut is built, in way of each column, which distributes the load to the keel.

Accommodation is arranged for officers and crew on a flat below the main deck forward on both sides, and everything necessary for full day and night crews is provided. The vessel is fitted with electric light throughout, and an electric winch with two winding drums is fitted between girders of the tidal deck for hauling cars off and on the vessel. Two powerful steam windlasses are fitted, one on each side with slip drums for mooring. A complete installation of auxiliary machinery has been provided and the hull and machinery complies with Lloyd's requirements.

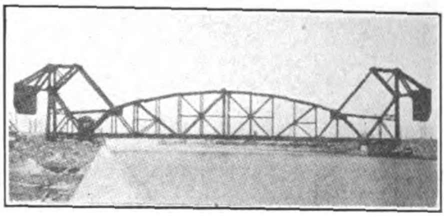
Although it was anticipated that some delay would occur in allowing the vessel to cross the Atlantic, she arrived at Quebec safely, August 18th.

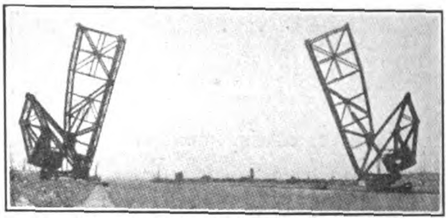
Largest Bascule Bridge in the World.

THE Canadian Pacific has recently finished the construction of a bascule bridge crossing the canal cut recently completed by the United States in Sault Ste. Marie, Michigan, which represents the largest structure of its kind in the world. The bridge is 336 feet in length between centres of main trunnions, each leaf being hinged on a steel tower and counterbalanced on the opposite side of this tower. The counterweights consist of masses of reinforced concrete, each containing approximately 530 cubic yards of concrete weighing 1300 tons. So exact is the balance that only a comparatively light power is required to raise the leaf and lower the counterweight.

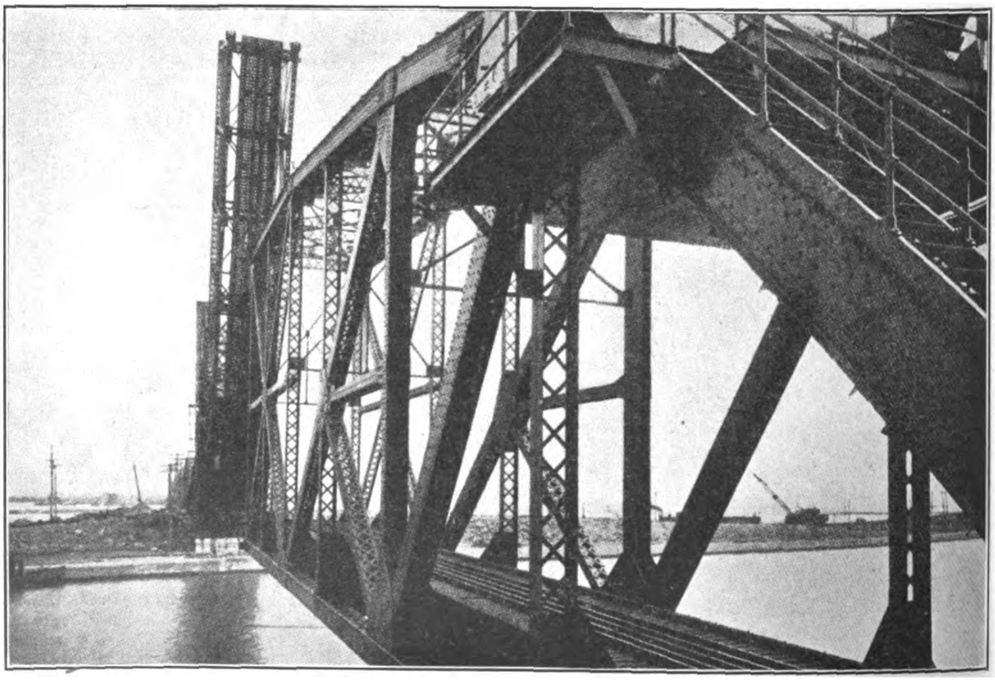
The south leaf and tower are supported on roller bearings, allowing a six inch movement to the entire southern leaf and tower in a longitudinal direction, to permit free expansion from temperature. The operation of this movement, when necessary, is accomplished by an oil pump in such a manner that the entire tower and attached leaf can be moved in either direction so that the two leaves exactly connect.

While it will be necessary to open both leaves for vessels of large dimensions and deep draught, it is anticipated that vessels of lesser draught may safely pass through with one leaf open.





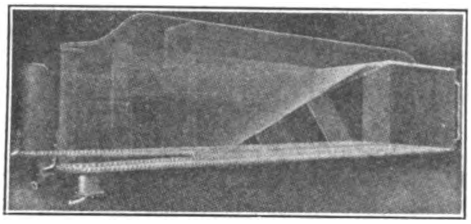
PHOTOGRAPHS SHOWING THE BRIDGE IN CLOSED AND OPEN POSITIONS. THE BALANCE IS SO EVEN THAT VERY LITTLE POWER IS NECESSARY TO OPERATE THE GREAT LEAVES. FOR SMALLER VESSELS IT IS ONLY NECESSARY TO OPEN ONE LEAF.



THE LARGEST BASCULE-BRIDGE IN THE WORLD RECENTLY ERECTED BY THE CANADIAN PACIFIC RAILWAY BETWEEN SAULT. STE. MARIE, MICH., AND SAULT STE. MARIE, ONT.

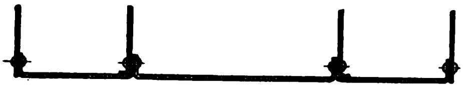
Flanged Locomotive Tanks.

ATTENTION was called in the May issue of the "Railway World" to an improvement made by F. N. Hibbits, superintendent of motive power, Lehigh Valley Railroad, who by the simple expedient of bending a piece of steel, solved the problem of eliminating leaking tender tanks. The Acme Flanged Sectional Locomotive Tank, which has recently been placed upon the market, and which has caused so much favorable comment, is the outcome of the development of Mr. Hibbits's idea. The accompanying photograph gives an excellent idea of the details of this tank and the improvements brought about by the sectional construction.



Phantom View of the Acme-Flanged Locomotive Tank.

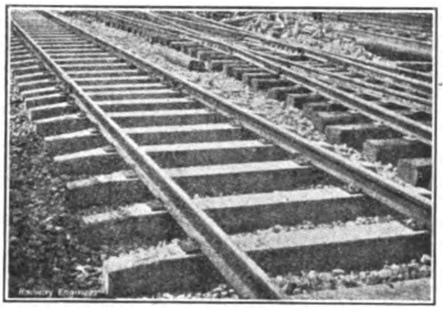
The Acme tank differs from those of ordinary construction in that the latter must be lifted off the deck every time it is necessary to renew or calk rivets or calk the seams, while the entire bottom of the former rests firmly and smoothly on the tank floor or deck and consequently there are no strains by reason of the usual uneven service of the tank bottom. Furthermore, the center section of fan is directly under the water intake, and tends to retain pieces of coal, cinders and sediment passing through the screen, and preventing them from reaching the side fans and clogging the injectors. The construction throughout is strong and simple, and gap riveter is used instead of the "gun" type of riveter in the top and bottom flanges. The complete absence of angle and tee irons, and sharp corners in the interior of the tank, also aids in prolonging the life of the bottom of the tank.



SECTION OF ACME-FLANGED TANK BOTTOM, SHOWING METHOD OF RIVETING SECTIONS TOGETHER.

A New "Sleeper" from Germany.

A NEW railway sleeper patented and manufactured under the name of "Asbeston," has recently been given an experimental trial on the State Railways of Saxony. It is stated that these sleepers have a distinct advantage over those of reinforced concrete construction in that they are said to be as elastic as wood under the rails and can be readily bored so that the ordinary rail fastenings can be employed. Notwithstanding this elasticity, however, it is stated that they must be handled carefully and not dropped or pitched about which, from the standpoint of American railway operations, would appear to offer a very serious difficulty.



"Asbeston" Sleepers Which Have Proved Successful in Experimental Trials in Germany.

They are, however, very highly spoken of by the authorities of the Saxon State Railways, on which they have been laid for more than two and one half years without the fastenings loosening in the least. This last is of course an important point as most wood sleepers are taken out on account of the wood failing around the fastenings. Certified tests made at Liepsig show that while three spikes in wood drew out under a pull of about 3,175 pounds, three spikes in the "Asbeston" sleeper showed no sign of drawing under a pull of 5,512 pounds. When screws were tested the pulls were 7,537 pounds and 7,762 pounds respectively with the same results. The compressive load sustained without cracking was 70,750 pounds.

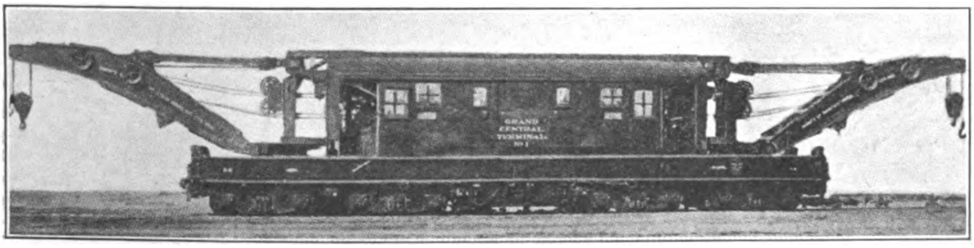
The "Asbeston" sleeper is about three times the weight of a steel or wood sleeper.

The union between the "Asbeston" under the rail seats and rest of the reinforced concrete is said to be complete.

These sleepers are much more costly than either wood or steel sleepers, but it is claimed that this is not a matter of great moment because of the great economy of the maintenance charges and because their life is said to be unlimited.

New Tunnel Crane for New York Central.

A NEW 100-ton tunnel crane has recently been received at the Grand Central Terminal, New York, for use in case of tunnel accidents. The crane is of the double-



New York Central's New Electric Tunnel Crane of 100-tons Capacity.

end variety, electrically operated and is especially designed for the underground clearances and conditions existing in and adjacent to the Grand Central Terminal. It is also adapted, however, for use on the main line of the electric division and can be dispatched at high speed under its own power to the scene of an accident anywhere on this division. In other words, it combines the function of a crane with those of a high power electric locomotive. The accompanying illustration gives an excellent idea of its general appearance.

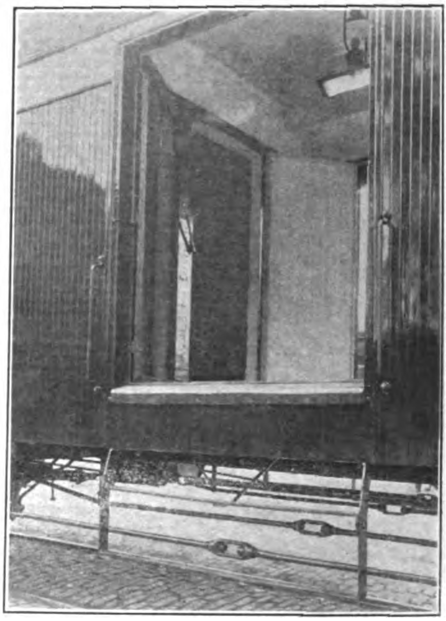
The Installation of Modern and Sanitary Dairy Refrigerator Cars by the Baltimore and Ohio.

ADVANCED steps in the interest of public health have been taken by the Baltimore and Ohio Railroad with the placing of four modern and sanitary dairy refrigerator cars in service to handle milk daily between points in Ohio and the Pittsburgh market.

The new cars which were built in the Mount Clare shops, at Baltimore, according to specifications approved by the United States Department of Agriculture, will insure the arrival of milk in Pittsburgh at a temperature of 45 degrees from the creameries at Ravenna, Newton Falls, Chardon, East Claridon, West Farmington, Painesville, Chicago Junction and intermediate points after a run of five hours. All possibility of the growth of bacteria while milk is in transit is removed, health authorities and railroad officials stating that the new cars will retain their uniform temperature for 48 hours with but one icing when the thermometer registers 90 degrees.

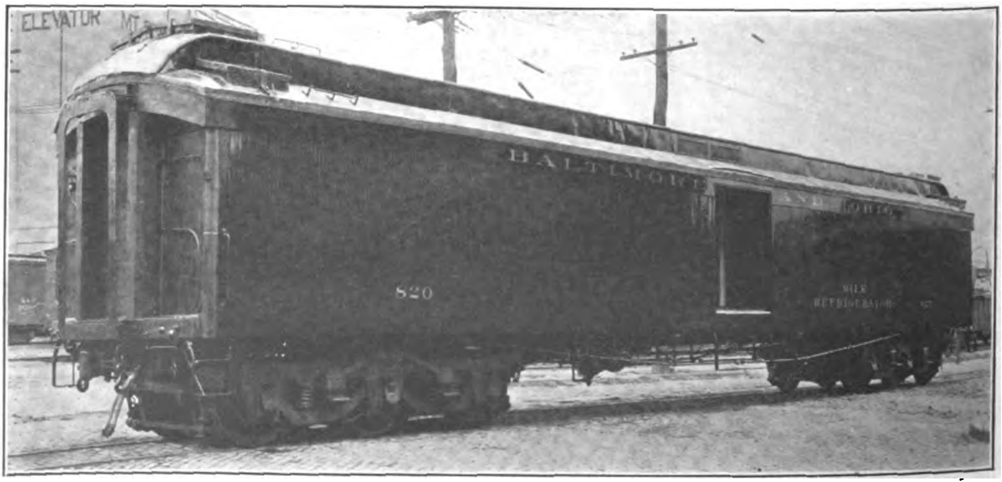
The interior finish of the cars is of white enamel, affording every precaution against the harboring of germs and in harmony with the general cleanly appearance. The cars are the same type of appearance as postal cars, being 60 feet long and so constructed as to provide practically hermetical sealing, which is essential in the hauling of milk for long distances from dairy regions to central markets.

"Milk Refrigerator" is lettered on their sides in gold leaf. The cars have double floors of yellow pine and covered with "flexolith," the most improved sanitary floor covering in use. The material permits of a thorough flushing of the cars in cleaning the equipment.



INTERIOR VIEW OF PASSAGE-WAY BETWEEN BULK HEADS SHOWING DOORWAY INTO REFRIGERATOR COMPARTMENT ON LEFT HAND SIDE.

The cars are designed for brine refrigeration and represent the highest development in scientific refrigeration of milk. In each end are ice bunkers, extending from floor to roof, containing six brine tanks in which are carried ice and salt. Two bulkheads five inches thick with refrigerator doors, are built across the cars on each side of the center doorways, thus creating two cold storage compartments with a floor space of 176 feet each and with capacity for thirty ten-gallon cans.



NEW SANITARY MILK REFRIGERATOR CAR OF THE BALTIMORE AND OHIO.

Locomotive Arch Brick.

AT the September meeting of the Central Railway Club, Mr. George Waystaff, of the American Arch Company of New York City, delivered an interesting address upon the locomotive arch brick. After describing the varieties of clays employed in the manufacture of these bricks and the various processes involved, he said:

"It is estimated that there are at present in the United States and Canada between 29,000 and 30,000 engines equipped with fire brick. Of this number, about 19,000 have tube supported arches, between 7,000 and 8,000 have stud supported arches, about 3,000 are oil burners, and about 127 have the Gaines combustion chamber. Of this latter, 74 are the straight wall type, and 53 are the locomotive furnace engines, or wall and Security Arch type.

"The Gaines locomotive fireboxes with combustion chambers are developing nicely, 127 locomotives being in actual service and equipped with various designs of this device, reports to date being very encouraging. It looks as though this device has come to stay and will have a brilliant future.

"This is not recommended to supplant arch tubes and sectional brick designs. There are a large number of locomotive fireboxes with very little throat depth at front end, and the bottom row of the fire tubes are so close to the top of the grates that it is not practicable to apply arch tubes and arches. This improvement is in its experimental stages. The object of developing these vertical and inclined walls in this design of locomotive was to find something feasible that would reduce the amount of flue blowing and flue repairs.

"The first and reasonable objection was the reduction of grate surface necessary for foundation of the brick wall. Tests are very encouraging along these lines. We are beginning to believe that the grate surface of the two front grates in a long, shallow firebox is of comparatively little use, and that the presence there of a hot refractory wall instead is of more benefit.

"The vertical and inclined walls are all constructed with air passages through the wall, so that a liberal quantity of free air is forced into firebox above the fire. Locomotives equipped with these walls are in the same class of service that they were in previous to the wall being applied, and they are steaming better, showing a decided improvement in combustion and smoke condition, and the blowing and repairing of flues being nearly eliminated.

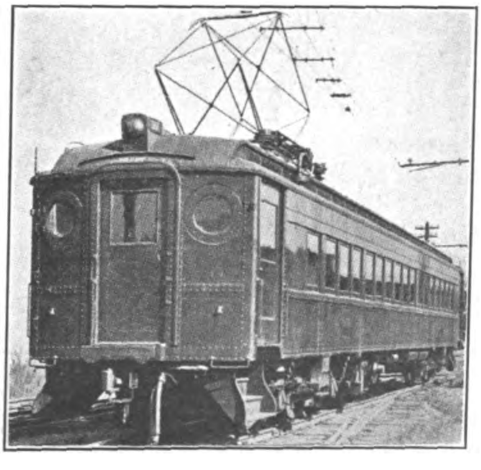
"Some fuel economy is being realized in every case, but enough fuel tests have not been made to strike a general average."

Electrical

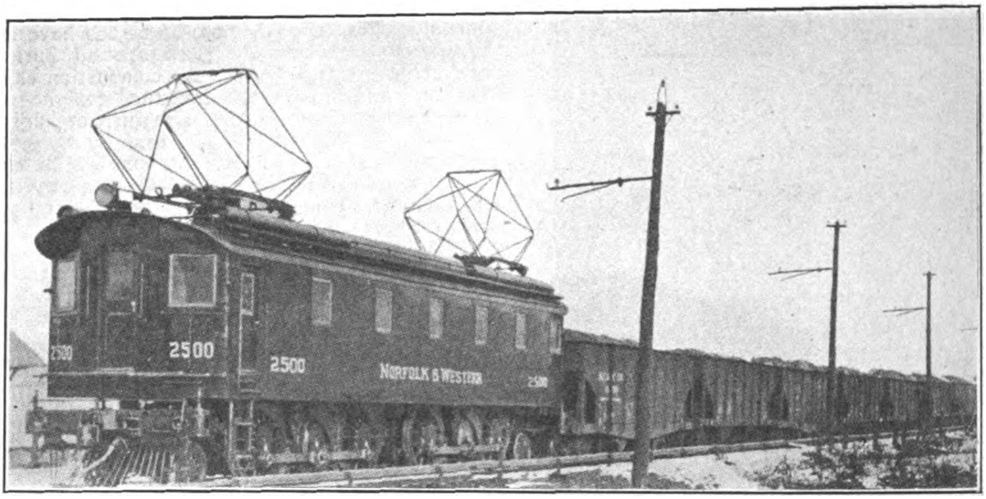
Progress in Electrification of Steam Roads.

THE Westinghouse Electric and Manufacturing Company has recently prepared an interesting pamphlet showing the progress which has occurred in the electrification of steam roads during the past year. With regard to the Pennsylvania Railroad it states that the electrification of twenty miles of the main line of this system extending from Philadelphia to Paoli may be considered to be the first installment of a general electrification plan, and that the ultimate completion of this plan will include the operation of the most important and extensive railroad traffic in the world.

After an exhaustive investigation, it has been decided to employ the single-phase system on the Pennsylvania as the most desirable for the Philadelphia suburban electrification; and the Westinghouse Electric and Manufacturing Company has been awarded the contract for the electrical equipment and for the motor cars required. The type of motor car is indicated in the accompanying illustration. These cars



GENERAL APPEARANCE OF THE NEW MULTIPLE-UNIT ELECTRIC CARS TO BE USED IN SUBURBAN SERVICE BY PENNSYLVANIA RAILROAD.



A Norfolk & Western 135-ton Half-unit Electric Locomotive and Train.

will operate from an 11,000-volt single-phase trolley and are each equipped with 225-H. P. motors and Westinghouse unit switch control. An operating speed of sixty miles per hour is contemplated with three to seven car trains with a maximum provision for ten car trains when required.

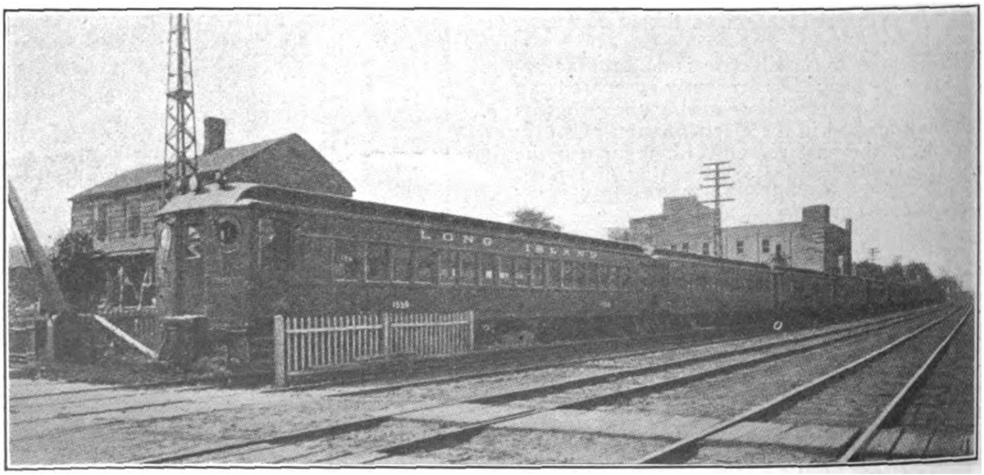
Speaking of the progress which has been made in the Norfolk and Western electrification, it is stated that the equipment, which so far consists of twelve 270-ton split-phase locomotives, is made up of two 135-ton half-units. The mechanical parts of each half, constructed by the Baldwin Locomotive Works, consist of a single box-type cab mounted on two articulated trucks, each truck carrying two three-phase motors. This type of motors makes these locomotives particularly adapted for service on heavy mountain grades.

Test results show these machines to be the most powerful electric locomotives in the world and the tractive efforts developed with a single pair of motors at a standstill, give a draw-bar pull of 42,500 pounds, indicating a draw-bar pull of 170,000 pounds per locomotive or 85,000 pounds per half unit.

The installation of these powerful locomotives on the Norfolk & Western Railway will permit an operating speed of fourteen instead of seven miles per hour with 3,250-ton coal trains. This doubles the capacity of the overcrowded 30-mile division between Vivian and Bluefield, West Virginia, and permits of the speedy handling of the large coal traffic, which originates on this section, most of which must be hauled up two per cent grades and through the Elkhorn Tunnel.

The power station will be located at Bluestone, W. Va. The electrical equipment in this station will consist of three Westinghouse 9,000-kva., three-phase, 25-cycle, 11,000-volt, 1,500-r.p.m. turbo-generators, a motor-generator exciter set and switchboards for controlling this apparatus. Single-phase step-up transformers are also to be supplied for the 44,000-volt transmission lines for feeding the transformer substations.

The pamphlet also deals with the completion



Multiple-Unit Electric Train Used by the Long Island Railroad for Suburban Service.

of the electrification of the New York, New Haven and Hartford Railroad to New Haven, which permits the operation of an entire steam locomotive division by electricity, being the first operation of this character ever realized.

The electrified zone of the New Haven System now includes approximately 550 miles of electrified track comprising the complete New York Division to New Haven, the Harlem River Division and the New York, Westchester and Boston Railroad. More than one hundred electric locomotives are required in addition to twenty-three motor cars and forty-four trailers used in suburban service.

The Long Island Railroad Company has also, during the past year, installed a number of additional double motor equipments which are now used for high speed trunk line suburban service with heavy modern steel cars. The principal traffic is handled by motor cars operating in multiple unit trains and the frequency and extent of the service, as well as its flexibility and reliability, have attracted the attention of operating officials in many sections of the country.

Other smaller roads have installed electrical equipment during the year, but the principal advance in the adoption of this class of propulsion, is in the four systems as indicated.

Terminal Improvements

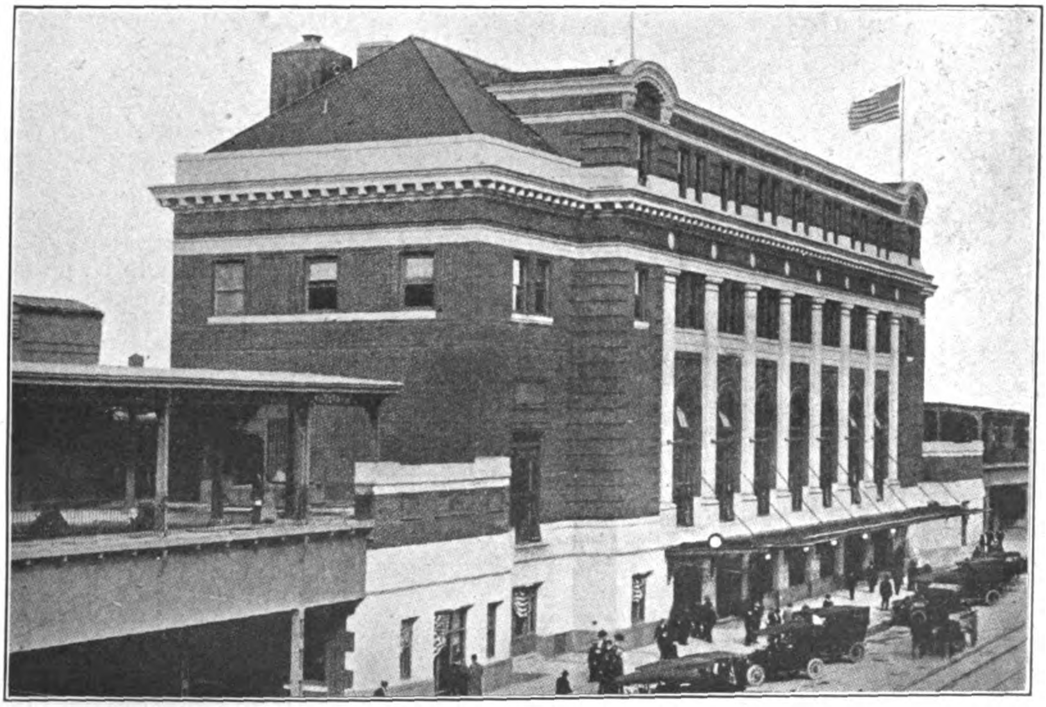
The New Union Station at Spokane, Wash.

THE new Union Station at Spokane, Wash., referred to in the "Railway World" of November, 1913, as in the course of construction is now completed. It is operated jointly by the Chicago, Milwaukee and St. Paul Railway and the Oregon-Washington Railroad and Navigation Company. The entrance as well as the ticket office and baggage room, are on the street level, while the general waiting room, with separate rooms for men and women, is on the second floor. The tracks which lie at the level of about 2½ stories, are reached by means of a mid-way from the general waiting room which runs out under the tracks and by means of stairways leads up between the tracks to the platforms at track level. Elevators are used to lift baggage from the ground floor to the track level. The third floor is reserved for offices and is occupied by the division superintendents and engineering departments of both roads.

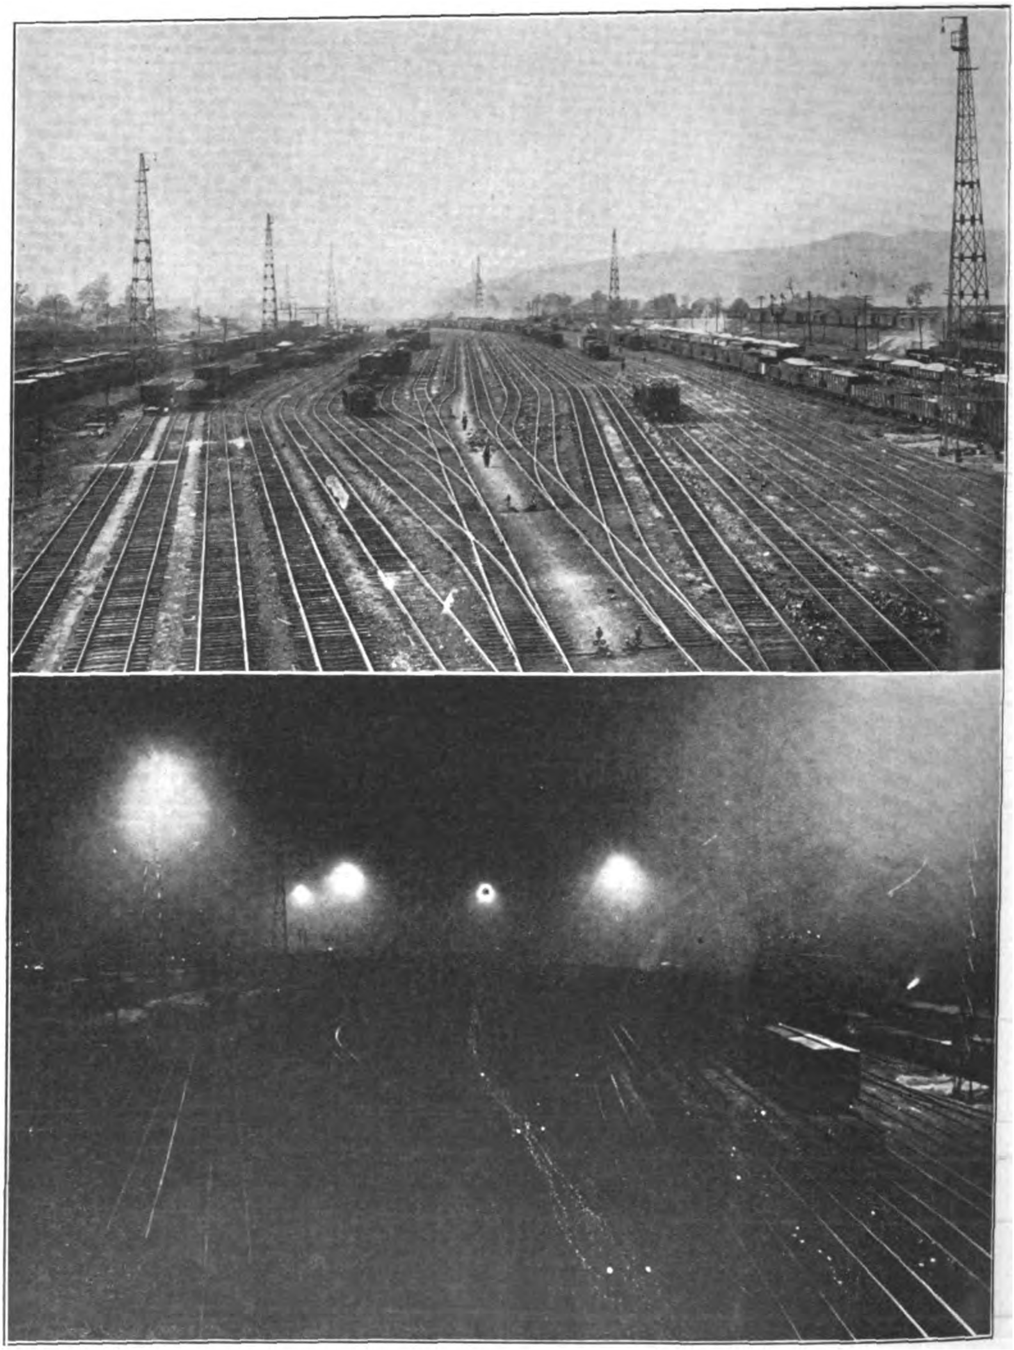
Red brick and yellow clay tile were used in wall construction, the roof being covered with red tile. White stucco is used for interior wall finish, while the floors are laid with mosaic. At night an indirect system of lighting is employed, the electric lights being hidden in the ceiling behind false beams, the flanges of which serve to reflect the light.

Classification Yard Lighting of the P. and L. E. R.R. at Pittsburgh.

IT is a very generally known fact that the average railroad derives its revenue principally from freight traffic, often carrying passengers at a loss. Therefore, anything



THE NEW SPOKANE, WASH., UNION STATION EMPLOYED JOINTLY BY THE C. M. & ST. P. RY., AND THE O. W. R. R. & N. CO.



Two Views of the Classification Yard of the Pittsburgh and Lake Erie Railroad at Pittsburgh, the Upper Showing the Steel Towers on Which Powerful Electric Lights Have Been Installed and the Lower Giving Some Indication of the Illumination Procured by This Source at Night.

that tends to facilitate the movement of cars or handling of freight is looked on with favor by the railroads.

Of the very greatest importance in freight handling but little known to the general public because of its infrequent contact therewith, is the classification yard. The function of this yard is the collection of freight cars into trains for specific destinations or routes. After the train has been made up with its proper quota of cars, it proceeds to the receiving yard where it waits until opportunity is afforded for it to pass out over the scales and be weighed, and proceed thence on its route.

The car or group of cars entering the yards travels by gravity under the care of a rider who directs it to its proper place in the yard and from whence he returns a foot to the head of the yard where additional cars are obtained and distributed.

As these yards are in operation 24 hours a day, it may easily be realized how important it is to have them properly lighted.

An interesting discussion of the lighting of railroad yards is given in a paper recently presented by Messrs. H. Kirschberg and A. C. Cotton on "Railroad Illuminating Engineering Track, Scale and Yard Lighting," before the Pittsburgh Section of the Illuminating Engineering Society.

The authors state that the freight haulage capacity of a road is as dependent on the scale and yard capacity as it is on motive power equipment, and that a congestion in the yards will reduce the earning power just as effectively as the disablement of a locomotive or other rolling stock.

The lighting of an area such as is presented by this class of yard affords some unique problems, the successful solution of which greatly facilitates the movement of freight traffic. The yard is not to be considered as an open area but, in reality, as a series of streets three or four feet wide, with buildings (freight cars) about fourteen feet high, on both sides.

One of the most effective installations of lighting in a classification yard recently made is that of the Pittsburgh and Lake Erie Railroad at McKees Rocks, just outside the city limits of Pittsburgh, Pa. This yard contains about twenty tracks extending for approximately one half mile.

The source of light is the Cooper Hewitt Quartz lamp, mounted on steel towers, as shown in the accompanying illustrations. The installation consists of eight units, the lamps being rated at 2400 candle power, with an energy consumption of 726 watts, resulting in an efficiency of .3 watts per candle. Direct current at 220 volts is supplied to the lamps from the power plant of the company located nearby.

The towers, which are twelve feet square at the base, are 100 feet high and are spaced about 400 feet, in two rows one on each side of the yard, or approximately 225 feet across. The lamp is suspended from a short mast arm which extends out over a platform for the attendant, access to which is had by means of a ladder mounted on the side of the tower.

A chain and a cut-out, however, permit the lamp to be lowered from the ground, thus obviating the necessity of the lamp attendant climbing the tower.

As the Quartz burners have a life of several thousand hours, and the globes are at such a height as to be out of the smoke zone, almost no cleaning or other attention is required.

The ideal condition of illumination of the yard, is of course to make it as light by night as by day, so that the riders, when directing the cars to their proper spaces in the yard, may be able to see clearly the location of other cars and thus prevent them from excessive "bumping."

The illumination of the McKees Rocks yards, which has been installed under the direction of Mr. D. P. Morrison, electrical engineer of the Pittsburgh and Lake Erie Railroad, very nearly approaches this ideal condition.

The light given by the lamps spaced as they are, completely floods the yards, enabling the men to see with proper clearness, not only every track and car but also the switches at the head of the yard. The illumination is such that one may readily read a newspaper at night. The entire absence of shadows and glare greatly facilitates the movement of the cars throughout the yard, by permitting the exact location of each to be easily determined, and also greatly adds to the safety of the men and tends to prevent accidents.

Possibly the best commendation given the efficiency of the installation is the statement made by one of the railroad officials that "the yard men never lose any chance to praise it." Considering the well known reluctance of the average individual to praise his working conditions, this statement is peculiarly significant.

In addition to the increased speed in handling cars gained through the better lighting, conditions are made much easier for the men returning a foot to the head of the yard, as when the yard is poorly lighted, it is difficult for them to avoid incoming cars, switches, posts and other obstacles, and the Pittsburgh and Lake Erie employes are particularly pleased with this feature.

The fact that the lamps are mounted at such a height permits an excellent distribution of the light which possesses an inherent color value that is particularly suitable for outdoor illumination.

Another feature that peculiarly adapts the Quartz lamp to this field of lighting is the steadiness of the light, other forms of illuminants having repeatedly proved unsatisfactory because of the unsteady light emitted, which was not conducive to good work.

The installation has not been in service long enough for any operating data to be secured, but in view of the high efficiency of the Quartz lamp and the minimum attendance required, it is confidently expected that the costs of operation will be equally as satisfactory as the other features of the installation.

Terminal Improvements in New York.

MAYOR MITCHEL, of New York City, has named Ralph Peters, president of the Long Island Railroad, P. J. Flynn, vice-president of the Delaware, Lackawanna and Western and F. L. Stuart, chief engineer of the Baltimore and Ohio, to serve as an advisory committee in connection with the contemplated port improvements and development at New York. It is planned by the city authorities to work out a comprehensive plan of enlarging the shipping facilities both by water and rail traffic and in such connection, the co-operation of the railroad companies is sought.

New Double Track Service at Birmingham.

THE recent construction by the Southern Railway at Birmingham of a new second track gives this road a double track line leading from Ninth Avenue via North Birmingham to the new Finley yard now being completed and has brought about greatly improved operating conditions in the Birmingham District. In the accompanying map is shown the newly constructed second track represented by dotted lines.

Dotted Lines Show the New Second Track Recently Installed by the Southern Railway at Birmingham, Ala.

Birmingham is an unusually busy one and the provision of a double track has been of great advantage as it means much more than simply a 100 per cent increase in track facilities doing away, as it has, with the necessity of operating on a positive block system, and eliminating a large amount of switching congestion and consequent delays of traffic. When the new classification yard at Finley is placed in service this new double track will be of great importance as all switching movements between the Finley yard and the Birmingham freight station and industries in Birmingham proper, will be moved over it.

Lackawanna's New Freight Station at Utica, N. Y.—The Lackawanna has recently completed a new freight station at Utica, N. Y., which embodies a number of improvements in a building of this character. The frame work which embraces a space 402 feet long by 51 feet wide, is of reinforced concrete with filled in brick panels. The main floor, which contains a public lobby, cashier's office, locker and lunch rooms is 382x48 feet wide. The second story which is 82x48 feet contains the private offices of the freight agent and chief clerk, general office for the clerical force and a filing room. The heating and lighting plants are located in the basement under the office portion of the building. The freight room is floored with timber laid directly on a cinder fill, and is pitched ¼ inch to one foot towards the street side to assist in moving freight. Concrete floors are used for both the first and second stories in the office portion of the building.

The freight doors are counterbalanced and are 10 feet 8 inches wide. Improved lighting is obtained for the freight room by the employment of steel sash above the canopy on each side of the house. The freight room is divided by three fire walls of brick with tin covered doors. The lighting equipment includes both gas and electric light. A dumb waiter connects the freight floor with the office floor and is employed for the transfer of bills, receipts and other material between the clerks' office and the cashier. Adequate fire protection has been provided, and that portion of the freight room under the offices is heated in the winter by steam pipes under the platform on the car side where perishable freight is also stored when necessary. The freight house is paralleled by three tracks with a total capacity of 74 cars. The driveways between the team tracks and along the house are paved with granite blocks.

Interstate Commerce Commission

Change in Wage Statistics.

THE Commission has announced a change in its wage statistics which will become effective during the next fiscal year. The new form which the railroads will be required to use in making their annual reports is much more detailed and comprehensive than the one now in force. It classifies employes into sixty-eight occupational groups, as compared with only eighteen groups for which information has been given in the past. This change will meet the criticisms that the general classifications used in the past did not correctly set forth the compensation of certain classes of employes. It will also be of very great value to wage arbitration boards, which have not been able, with the statistical information now available, to determine satisfactorily the actual earnings or wages of employes in certain occupations.

By way of illustration, the working forces of railroad shops have hitherto been classified as "blacksmiths, machinists, carpenters, and other shopmen." Under this grouping it was obviously impossible to determine what was the compensation of a car inspector, painter, car repairer, or other classes of employes. Under the new schedule, however, this situation is rectified by breaking up the old general classifications into distinct occupational designations.

In the same way the new statistics will make a distinction between, and show separately, the earnings of enginemen and trainmen in freight, passenger and yard service. The new form, in general, will afford, comparatively speaking, satisfactory classifications according to specific occupations.

Probably the most important change, however, in the new form of wage statistics consists in the elimination entirely of the figures relative to the average daily compensation of officers and employes. These now shown by the Commission have been generally recognized as unreliable and of no value. These have been obtained by dividing the total annual compensation of any given class of employes by the total average number of days worked during the year by the employes in the given occupation.

Under the new form all this is done away with and an hourly rate of earnings substituted for the average daily wage. The railroads will in the future be required to report for sixty-eight groups of employes the "total number of hours on duty during the year," and the "total compensation during the year." By dividing the latter by the former it will be possible to secure the average hourly earnings of the employes in the principal occupations. For trainmen, paid on a mileage basis, the showing as to earnings will be on the basis of each mile run.

Another radical change is found in the method of reporting the number of railroad employes. The practice has been to show the average number on duty on June 30th of each year. Under the new arrangement the railroads will be required to report the average number of employes in service for each alternate month in the year, together with the average for the entire year. The advantage of this change consists in the light which it will throw upon unemployment and irregularity of employment.

Commission Upholds Advance in Passenger Rates.

ACTING upon the suggestion set forth in the opinion of the Commission, the Eastern trunk lines filed new tariffs to be effective on October 1, 1914, increasing the price of mileage books open and interchangeable, from the basis of two cents per mile to two and one quarter cents per mile.

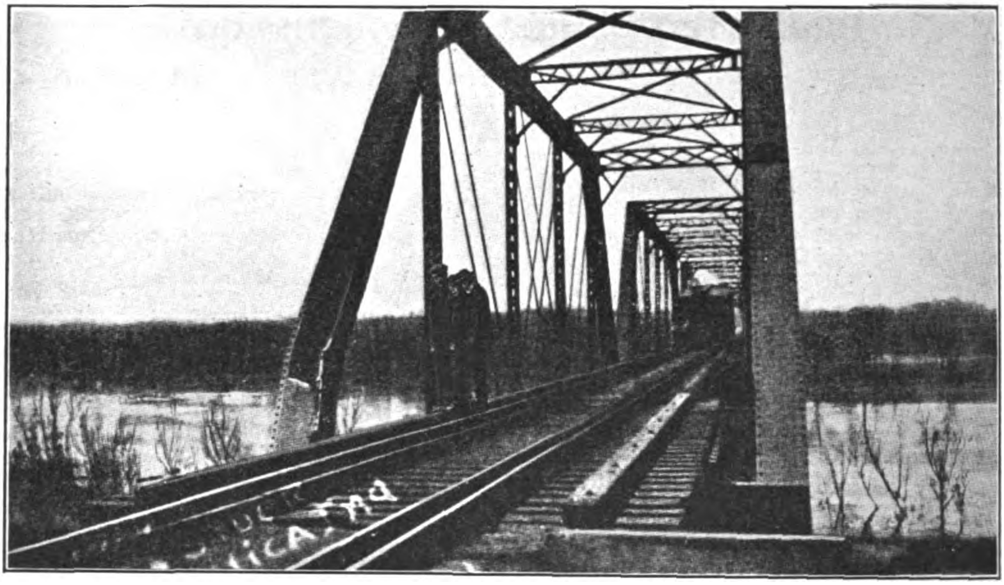
Protests against this proposed increase were lodged with the Commission both by individuals and by organizations, with the view of securing a suspension by the Commission of the proposed increase in mileage fares. The Commission declined to interfere and the increase went into effect on October 1. The reasonableness of the advances can be attacked by formal complaint, but the rates will continue operative until any complaint filed has been disposed of.

Report on the Wabash Derailment.

THE Commission through its chief of the Division of Safety, has issued a report on the derailment of eastbound passenger train No. 4, of the Wabash Railroad, at Attica, Ind., April 5, last, when three persons were killed. As reported at the time, this derailment was caused by running the train on to a bridge which had been weakened by a previous derailment. This first derailment occurred at a frog, but there is no study or explanation of the cause. The train, a freight train, was moving west. The car derailed in this train, the twelfth car, ran against the left or south batter post of the bridge and weakened it seriously. Subsequently, the freight engine had been backed over the bridge; and as this engine went over safely, and as the passenger engine was lighter than the freight, the passenger train was allowed to move over the bridge at about four miles an hour; but it broke through when on the span of which the weakened end post was a part.

James E. Howard, engineer of the Commission, examined the bridge, and he says that, while the passenger engine was lighter than the freight, it, with its adjacent car, caused a greater stress on the weakened post than did the freight engine and one car, because it was headed eastward. He calculates that when the passenger engine was on the weakened span the load on the end post was 186,800 lbs. and that when the freight engine was on the same span, this stress was 147,800 lbs.

It was reported at the time that the responsibility for allowing the passenger train to enter upon the weakened bridge was chargeable to the track supervisor, but Mr. Belnap says that, "while this man was apparently in charge, he did not personally notify the despatcher that it was safe for the passenger train to proceed over the bridge." After reviewing the testimony, Mr. Belnap says that, owing to the conflict in the evidence, responsibility for permitting the bridge to be used in its weakened condition cannot be definitely placed. The conductor of the freight, the station telegrapher and others testified at



View of Damaged End Post.

the inquiry, but the discrepancies in their testimony are not cleared up in the report.

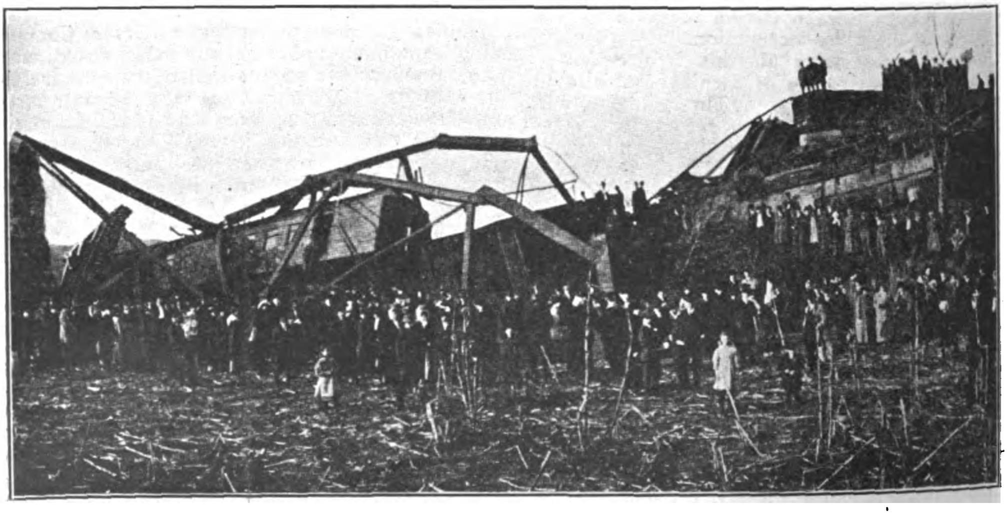
Engineer Howard says that the weakened condition of the bridge was clearly manifest and of a nature so serious that its dangerous condition should have been realized and traffic immediately suspended. This opinion appears to be based on the evidence of a photograph showing ruptures and distortion of the batter post.

The abstract of the testimony of the track supervisor indicates that he looked at the batter post and saw that it was "bent about six inches to the south," and yet he seems to have been so much influenced by the fact that the freight engine had passed over the bridge in safety that he took no measures to forbid the passage of the passenger train.

Changes in Express Classification to be Investigated.

THE Commission has ordered an investigation into the changes in the classification of express matter, proposed by the express companies affected by the orders of the Commission promulgated in connection with the decision of the express rate case of 1913. A formal hearing of the questions involved will be held in this city on October 30th.

For many months the express companies have been revising their classification of express matter, in conformity with suggestions of the Commission. As the changes include many changes in rates, it is necessary for the Commission to hold hearings before finally passing upon them.



General View of Wreck, First Span of Bridge.

Railway Investigations Postponed.

THE Commission has decided that, owing to the troubled financial conditions of the United States as a result of the European war, it will not immediately prosecute the proposed investigations into the Pere Marquette and other railroads, a financial investigation of which have been requested by Congress. These investigations will be postponed until some time in the future.

Investigation of Pipe Lines and Refining Interests Begun.

THE Commission has started an investigation into the production, transportation and marketing of crude petroleum.

The action was taken in compliance with a resolution of the Senate requesting the Commission to "make a thorough investigation of the conditions prevailing and that have prevailed in the States of New York, Pennsylvania, West Virginia, Oklahoma and Ohio or elsewhere," respecting oil production and trade; how, to what extent and by whom the oil market is controlled; financial inducements offered in the development of oil fields, the operation of pipe lines; and whether "the charge is true that substantially the same interests have operated the pipe lines, made the market, bought the crude oil, refined it and fixed the price of the refined products."

The Commission also is directed to ascertain whether any pipe line companies have recently stopped taking all or any part of the crude oil produced by independent operators. The Commission expects to direct particular attention to that phase of the inquiry with a view to ascertaining whether there has been a violation of law and collusion between pipe line and refining interests.

No dates have been fixed for hearings, and it is not expected that pending preliminary inquiries public hearings will be held before some time next year.

Further Hearings on Shreveport Rate Case.

FURTHER hearings in the Shreveport rate case have been granted on the petition of the Shreveport Chamber of Commerce and will be conducted by Commissioner Hall on October 27th at Shreveport. The original order as issued by the Commission a few months ago applies only to two roads and it is understood that the hearings which have now been granted will be held primarily for the purpose of supplementing the original order, making it applicable to all lines between these points and also to offer testimony in support of a plea for equalization of rates between other competitive cities and points within Shreveport territory.

Commission Enlarges Zone as Fixed by Intermountain Decision.

AN order has been issued by the Commission extending the boundaries of "zone 11," as fixed by the decision in the Intermountain rate cases, so as to include the greater part of the States of North Dakota and South Dakota, as well as a part of Minnesota not now in the zone.

Railroads operating in that zone are authorized by the order "to establish and maintain commodity rates from points of origin located in the territory to California terminals, and to maintain higher rates to intermediate points, provided the rates to the intermediate points do not exceed the rates on the same commodities from the same points of origin to California terminals by more than seven per cent."

Investigation convinced the Commission that "zone 11" was too rigidly restricted by the original decision, and that the carriers were unduly handicapped in making west-bound rates from that territory.

Switching Tariffs Suspended.

IN spite of the fact that the Commission, in its late advance rate decision virtually recommended that the railroads exact a charge for the switching performed for private corporations, various freight tariffs filed some months ago by the Eastern railroads which provided for a minimum charge of 5½ cents per ton and a charge of $2.00 per car for switching freight to and from points on private sidings and industrial plant tracks, have again been suspended from October 29th until April 29th. These tariffs were originally suspended from July 1st.

Christmas Gifts for European War Sufferers to be Transported Free.

THE Commission has issued a ruling to the effect that American railroads may transport free of charge, if they desire to do so, gifts made by the children of the United States for presentation on Christmas Day to the orphans of the European war. This ruling was announced in connection with the plans of an American newspaper to send a "Christmas Ship" abroad. The Commission made it clear, however, that the free transportation of such articles was entirely discretionary with the railroads.

Safety Device Inquiry.

THE Commission has issued a request for detailed information regarding all block signals and other train safety apparatus in use on American railroads. The request specifies that this information must be in Washington not later than January 15, 1915.

Rock Island Investigation.

DURING the past few months serious charges, many of them confusing, have been made against the Rock Island management. Even before it was first learned that another readjustment was pending, there appeared to be a constant misunderstanding of the relations that existed between the old railway company, the Iowa Holding Company and the New Jersey Holding Company. Charges and countercharges have been made of so grave a character that the Commission has begun an investigation covering the financial affairs of this Company and is making an effort, by calling witnesses at a public hearing, to either prove or discredit these charges and, in addition, to throw much-needed light on the whole Rock Island situation.

To Investigate the Little Kanawha Railroad.

IN compliance with the resolution of the United States Senate, the Commission has instituted an investigation into the operations of the Little Kanawha Railroad Company which operates a railway traversing the valley of the Little Kanawha in West Virginia.

The Senate desires to ascertain "whether or not the control of the stock is in the hands of any combination of railroads or of any trust or syndicate controlled by railroads engaged in interstate commerce, and whether or not the railroad is being held for any purpose other than as a legitimate branch of commerce, and whether it is being held to tie up and prevent the development of the Little Kanawha valley."

Demurrage Tariffs Suspended.

FREIGHT tariffs of Eastern roads proposing an increase in the demurrage charges on perishable freight in refrigerator cars have been suspended by the Commission until January 29th. The present charge is $1 per car per day in excess of the free time allowed. The suspended tariffs provided for an additional charge of $2 per car per day for the first two days after free time, and an additional charge of $3 per day for each succeeding day until the car is released.

Recent Decisions.

A NUMBER of decisions have recently been issued by the Commission of a significant and encouraging nature to the carriers.

The Commission has held to be lawful proposed increases in the proportional freight rates on grain and grain products from Kansas City, Mo., to Port Arthur, Tex., for export, applicable to traffic originating at various points in Kansas and Nebraska. The railroads are required, however, to cancel the tariffs under suspension and substitute others, omitting certain features objected to by the Commission.

A proposed increase in the freight rates on hides between points in New Mexico and Arizona to Los Angeles, Cal., from 80 cents to $1.20 per hundred pounds has been held by the Commission to be reasonable.

In its conclusions, the Commission held: "It is well established that neither the carriers nor the Commission may predicate rates on the necessities of the shippers and that efforts to equalize market competition may not justify or require rates that are unreasonably low nor permit unjust discrimination."

The Commission has held in the case of the New Orleans Live Stock Exchange and other cattle shippers against the Louisville & Nashville Railroad and others that a charge of $2.50 a car for cleaning and disinfecting cars, imposed upon the owners of cattle, was reasonable and not discriminatory. The service, it was pointed out, is required by Federal quarantine regulations generally.

The Commission has also declared reasonable, increased rates on rice between Helena, Ariz., and New Orleans, also an increase in the rates on the Southern Railway, the Baltimore and Ohio and other carriers on grain and grain products from the valley of Virginia to Carolina territory.

Refrigeration charges between New Orleans and Chicago have been permitted an advance of five cents a hundred pounds.

These increases, added to others which have recently been granted, constitute an encouraging indication that the Commission has at last adopted a more lenient policy towards the carriers.

STATE COMMISSIONS.

Ohio.—Urging free and unlimited co-operation between managers of industries and railroads, the Public Utilities Commission has addressed an open letter to the general public in order to avert a car shortage, which the Commission believes is possible during the season of crop movement.

"The supply of cars for this crop year is fixed," states the Public Utilities Commission, "and the task now before us is one of car economy, namely, how to keep the cars moving and performing a maximum service. Free and unlimited co-operation between the agents of our major industries—agriculture, mining, manufacturing and transportation—will be necessary, if the handling of the car supply is to attain to its fullest measure of efficiency. No one of these industries can shirk its responsibility without doing violence to the whole situation. For the agriculturists to insist upon monopolizing the use of freight cars and motive power of the transportation companies to move the last pound of their products to the exclusion of general merchandise would be destructive to economic distribution."

MECHANICAL.

New All-Steel Cabin Car for Pennsylvania Railroad.

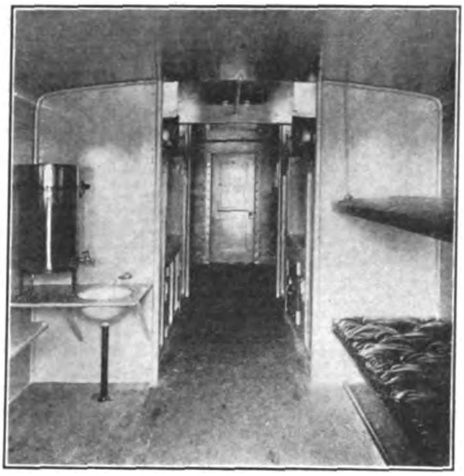
TO add one more unit to the steel equipment of the Pennsylvania Railroad, an all-steel cabin car has been designed, to be known as class "N-5."

Designers can well appreciate the difficulties encountered in working up a car of this type, as the severe conditions to which it is continually subjected makes it necessary that the construction be as strong as that of heavy steel freight cars. Local requirements vary considerably, and comfort and convenience also play an important part. The design of a cabin car must be intermediate between passenger and freight car design. Careful consideration has been given to each feature of the design, which will be shown by a study of the details.

This is believed to be the first all-steel cabin car ever designed. The inside lining, flooring through the passageway, platform floor, and window sash are the only parts for which wood is used.

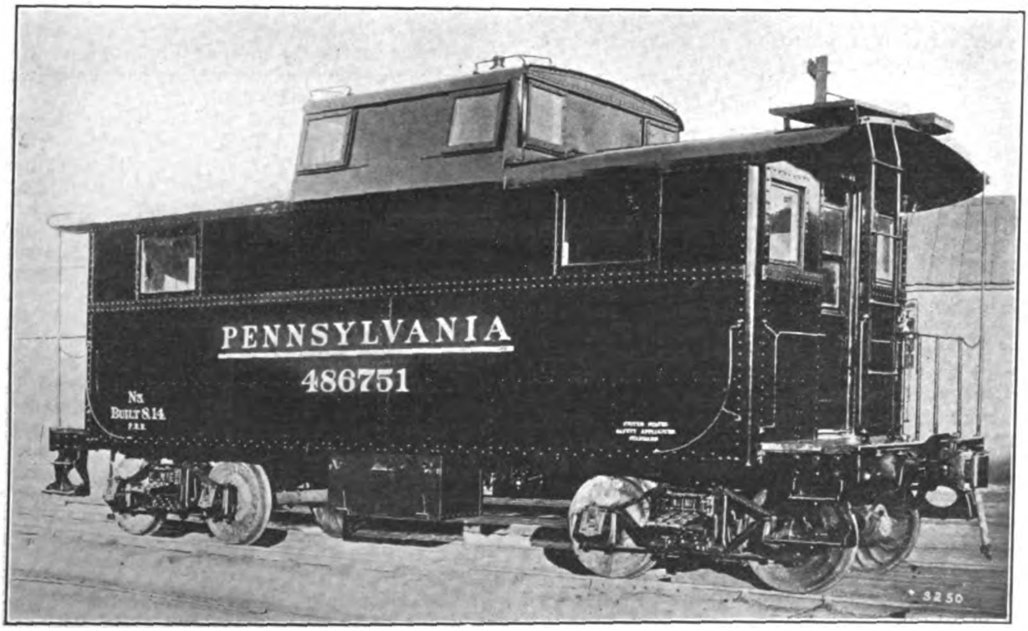
The car is 31 ft 0 in. from face to face of drawhead, 14 ft. 9½ in. high over cupola lamp, and 10 ft. 2½ in. wide over handholds. Each end of the car is equipped with 30 in. platforms, capped with a 1¾ in. floor, safety rails, side box step, and ratchet hand brakes in accordance with M. C. B. requirements.

The center sill or backbone construction of the underframe is the same as on freight cars and commensurate thereto in strength, being composed of two 10 in., 25-pound channels, a 21 in. x ½ in. coverplate riveted the full length of the center sills, and a 4 in. x 4 in. x ¾ in. angle riveted to the bottom of each channel, on the inside and extending continuously between back draft lugs, the total area being 36 square inches. The center construction is further reinforced at each end by a striking plate, a center plate reinforcing casting above the center plate, and pressed steel spreaders between the diaphragms. The front and back draft lugs are cast integral with the striking plate and center plate reinforcing castings. Two dished diaphragms ⅜ in. thick are located 3 ft. 7 13-16 in. on either side of the center line of cupola, which is 12½ in. off center line of car, and are securely riveted to the center and side sills. The usual body bolster has been eliminated and the body side bearings are supported by steel cantilever castings, which are securely riveted to the center sills and to a ½ in. tie plate, which extends across the bottom of the center sills out to the end of the side bearing castings. The floor support at the side, or side sill, is a 4 in. x 4 in. x ⅜ in. angle, the back of which points away from the center line of car. This angle is continuous between the side and end sill connecting castings, which form the side supports of the platforms and connect the side sills, the diagonal brace, and the end sills are shaped to form corner push-pole pockets. The diagonal brace, which transmits the horizontal strains from the side sill to the center sills, is a U-shaped section 6 in. wide and ⅜ in. thick, with 3 in. flanges pointing downward. They are flattened out at either end and securely riveted to the top flange of the center sills and the side and end sill connection. The end sill is also a pressed U-shaped section, which is fastened to the striking plate and the side and end sill connecting casting. The entire underframe, with the exception of the platform, is covered with a ¼ in. steel plate, which extends from the center sill cover plate to the side sill angle, giving to the underframe transverse and diagonal stiffness and increasing the longitudinal resistance. The brake rigging supports and the equipment box, which is 4 ft. x 0 in. long, 23 in. deep, and 21⅞ in. high, and secured to this floor sheet. The equipment box is made of ⅛ in. sheets, with a door at the front, which swings down, and is equipped with a handle for lowering and a hasp for securing when in position.



INTERIOR VIEW OF PENNSYLVANIA'S ALL STEEL CABIN CAR.

The superstructure of this car is rather unique, in that there are no posts, the transverse stiffness being obtained through the end construction and bulkheads, which form the sides of the locker at the center of the car. These bulkheads are so located that they are directly above the diaphragms of the underframe, and are securely



PENNSYLVANIA RAILROAD'S ALL STEEL CABIN CAR.

riveted thereto, thus forming four stiffeners at the center of the car 3 ft. 0 in. deep. The sides and ends of the car are made up of ⅛ in. sheets and a 4 in. x ½ in. belt rail. The bottom panel is composed of two sheets, joined together on the center line of cupola by a butt strip, and butting against the top side sheets beneath the belt rail, which is 4 ft. 2 in. from bottom of the side sill angle. The top panel is composed of three sheets, which are joined together by the window frames. At the corner the side and end sheets are connected by a 3-16 in. coverplate, which acts as a corner post. The end construction is of the same general design, the sheets being fastened to the underframe by a 2 in. x 2 in. x ¼ in. angle, as well as riveted beneath the corner coverplate, the belt rail and the end door frame. The end is further supported by two 4 in. channels, which act as door posts. These channels are fastened at the bottom to a cast steel threshold plate and the underframe, while at the top they are secured to the roof sheets.

On the inside of the belt rail, and at the eaves, extending from end sheet to bulkhead, is a U-shaped section, which stiffens the sides of the car at these points, and also provides a means of securing nailing strip to support the lining.

The side window frames, which are riveted to the outside of the side sheets, are 3-16 in. thick. A ½ in. x 3-16 in. filler extends along the top of the side sheets, between window frames, so that it is possible to extend them up under the roof sheets, making the construction waterproof, and at the same time forming a straight surface to which the roof sheets can be attached.

The construction of the cupola, which is of the same general type, extends 2 ft. x 6 in. above the main body of the car. The cupola side and end windows are all hung on the outside, a top guide rail being incorporated with the eaves, while the window sill forms the bottom guide. This construction is such that when the window is pushed up against the end projection strip it forms a weather tight construction. The object in placing the windows outside is to leave the interior smooth. The sides of the cupola are inclined towards the center line of car to give tunnel clearance.

The roof sheets, which are 3-32 in. thick, extend lengthwise of the car in three panels, two of which—forming side panels—extend down over the sides of the car and fasten to the side sheets and eaves, and a central panel, which overlaps the two side panels and is secured with ¼ in. rivets spaced 1½ in. apart. Tar paper is placed between the lap of the center and side sheets, to insure a water-tight joint. The main roof is supported by U-shaped purlines, which extend from end sheets of car to the cupola end sheets. The cupola roof is of the same construction. These purlines answer the double purpose of supporting the roof and providing a means of securing nailing strip for the ceiling.

The main roof extends over the platform 2 ft. 2½ in., and has a 2 in. x 2 in. x ¼ in. angle extending around the edge, which lends stiffness to the structure, and also acts as a weather strip for leading the water away from the cases over the platform.

The roof is equipped with running board, latitudinal extension, and grab irons according to M. C. B. standards.

Convenience, comfort and safety are the features given greatest consideration on the inside. The car is equipped with a stove for heating and cooking purposes, a drop table, water cooler, washstand, refrigerator, desk and hopper, as well as lockers, drawers and cupboards for the men's personal belongings. Three pairs of bunks, upper and lower, are located along the sides of the car; one at stove end and two at the opposite end. The lower bunks are of a box type, 6 ft. 10 in. long and 2 ft. 5 in. wide, in the bottom of which may be stored equipment necessary to the car. The upper bunks, which are the same dimensions, are attached to the belt rail by means of a cast steel hinge bracket, and when not required may be lowered and used as a back for the lower bunk when used as a seat. The upper bunks, when raised, are held in position by chains secured to the roof purlines, and hooked to the side of the bunk frame, which is composed of 1¾ in. x 1¾ in. x ¼ in. angles, to which wooden nailing strips are secured for tacking down the canvas top. Including cupola seats, the car has sleeping facilities for eight men, the cupola seats being the same width and length as the bunks.

The lockers, which are located between the bulkheads and lower cupola seats, contain the refrigerator in the lower center section, on the side opposite the stove, and the hopper in one of the end lockers on the other side. The arrangement is such that there is ample room for dishes, food, lamps, oil and waste. All locker doors, drawers, shelves, etc., are 1-16 in. thick.

The side and end windows are above the belt rail, so that the light is not cut off when the upper bunk is raised. The side windows are fixed, while those at the end, including the end door windows, may be dropped. All locks or catches, with the exception of the refrigerator door lock, are flush, thus eliminating projections against which a man might be thrown by a sudden lurch of the car. The cupola is also equipped with a safety rail, extending between end sheets of cupola on center line of car, which is also of convenience as a handhold when descending from the cupola seat.

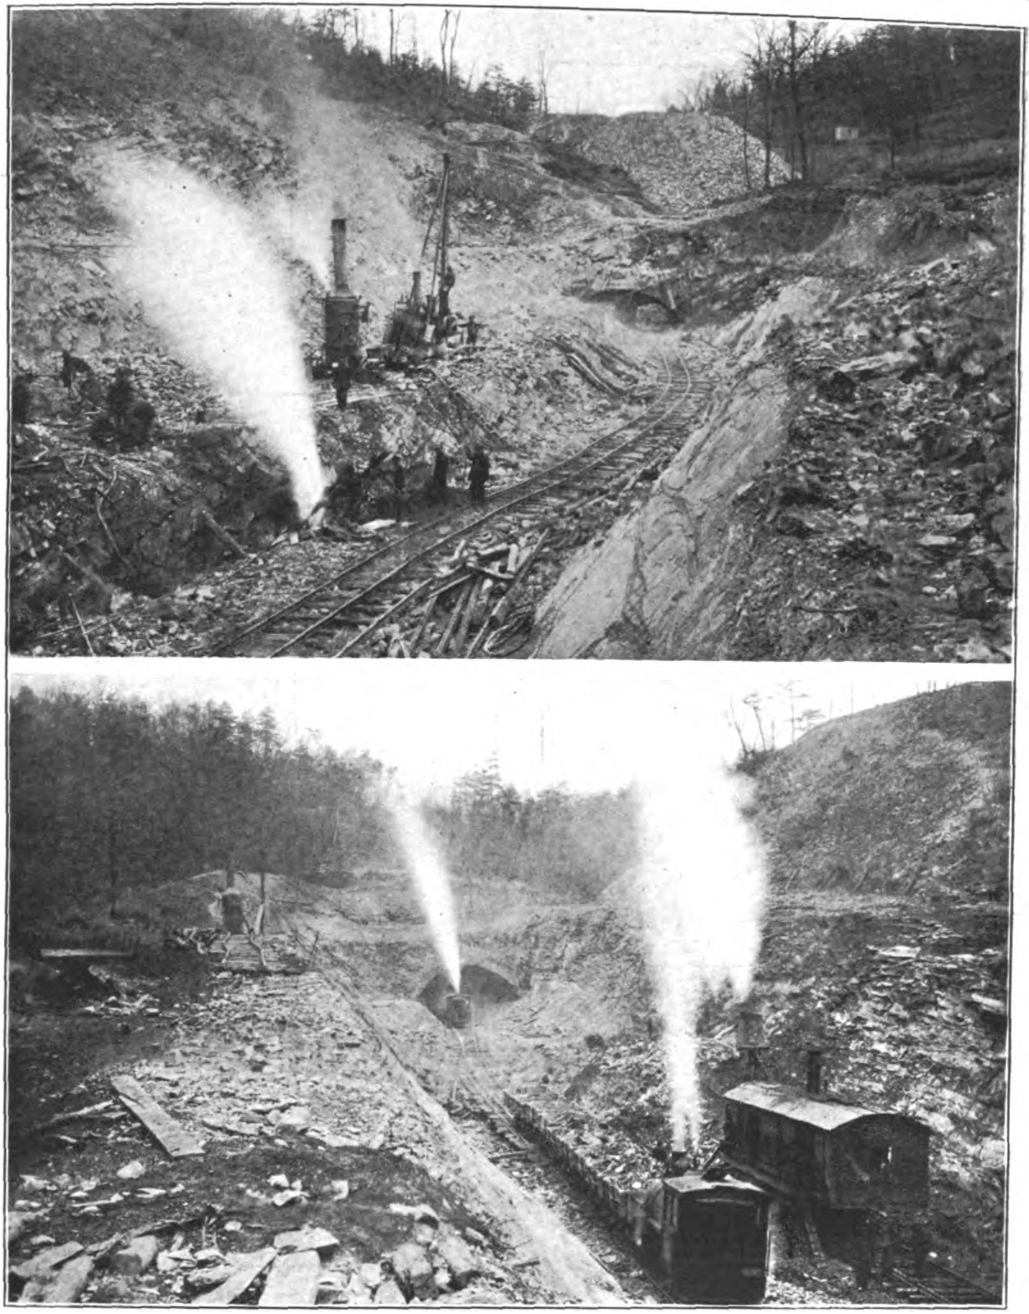
The car is equipped with specially designed arch bar trucks of 5 ft. 0 in. wheelbase, having axles with 3¾ in. x 7 in. journals. The usual column castings are replaced by a malleable casting which serves as a column casting, brake hanger support, spring seat, and spring plank extension. The bolster is of the inverted U-shaped type, with malleable iron stiffening castings, spring seats and bolster guides.

The springs are full elliptical, 34 in. long, three in each group.

The truck is tied together at the center by a U-shaped spring plank ⅜ in. thick and 8 in. wide, with 1½ in. vertical legs turned upward. The spring plank extends across the truck 4⅝ in. beyond the center line of arch bars, and is flattened out at either end and bolted to the bolster guide spring seat and brake hanger support.

EQUIPMENT.

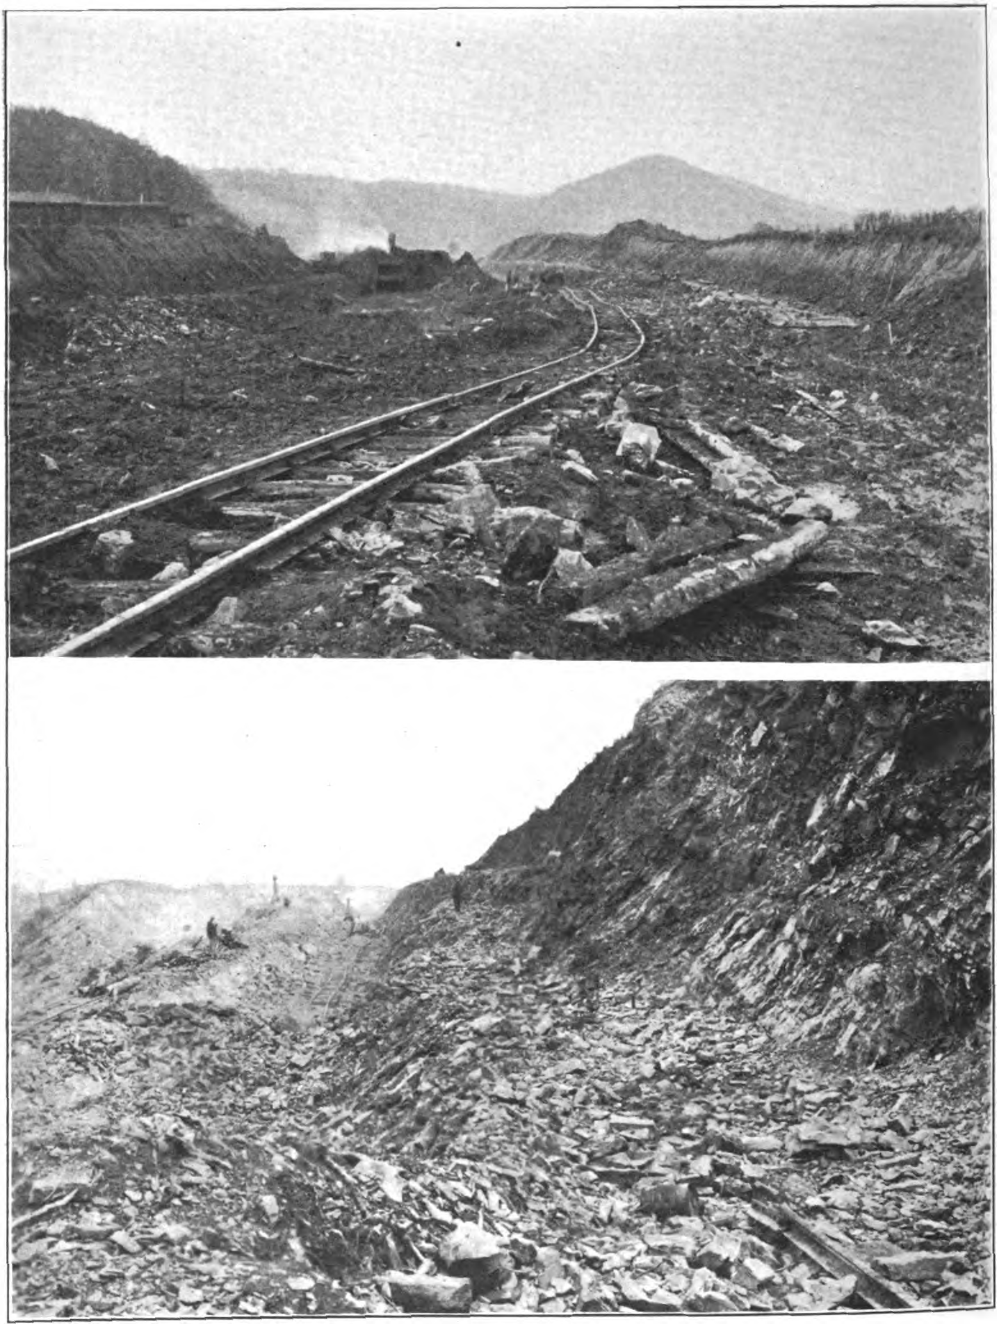
The Economic Significance of the Magnolia Cut-Off of the Baltimore and Ohio Railroad.—Discussing from an economic standpoint the



Two Views of Construction Work on Magnolia Cut-Off of the Baltimore and Ohio Railroad. Upper Photograph Shows East Approach to Stuart Tunnel: Lower, West Approach to Same Tunnel.

Magnolia cut-off of the Baltimore and Ohio Railroad between Orleans Road and Little Cacapon, W. Va., Harry C. Plummer, in "Scientific American" points to the ultimate saving which this improvement will effect in the future cost of operation. The writer ranks the project as "among the great engineering feats of American railroading." The article is comprehensively illustrated with views showing the progress of the work.

"It accomplishes for the B. & O. two distinct economic advantages," continues Mr. Plummer. "It effects a saving of 5.8 miles in the length and 887 degrees of curvature of the eastbound tracks and does away with a sharp grade at Hansrote, which has required the use of pusher engines for eastbound traffic climbing the mountains at that point. Secondly, it completely equips the B. & O. as a three-track and four-track system east of Cumberland, Md., to Martinsburg, W.

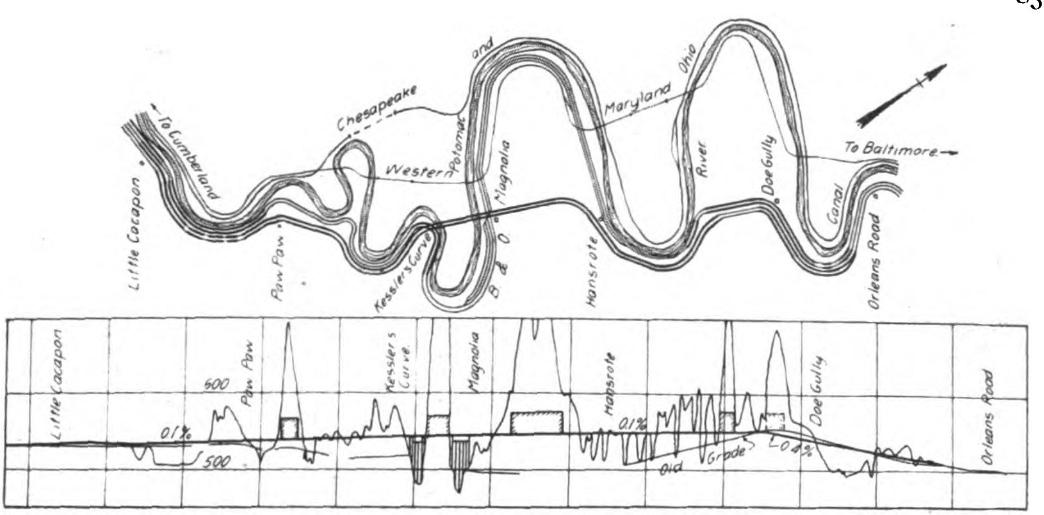


West and East Views of the Cut of James F. McCabe. An Expensive Engineer Feat Which Will Be More Than Justified in Reduction in Future Costs of Operations.

Va., and, in conjunction with extensive track additions on the mountain divisions, effected during the last three years, provides ample facilities to care for the almost indefinite future.

"Factors of economic operation were directly responsible for the Magnolia cut-off improvement being undertaken by the Baltimore & Ohio Railroad. Embraced in a general economic study of its operation is the plan eventually to overcome the high operating costs in mountainous country by revising its line, reducing grades, eliminating curvature, and doing away with helper engine service on that section of the line eastward from Cumberland, Md.

"The plan contemplates a four-track system of 105 miles, from Cumberland to Brunswick, the point of intersection of the Cumberland and Baltimore divisions. In fact, the ultimate plan is to continue the four-track line to the sea-



Map and profile of the Magnolia cut-off.

board at Baltimore, with the construction of third and fourth tracks from Brunswick to Washington Junction, Md., where two two-track lines converge toward Baltimore, one by way of Washington, the other through Frederick County. So, when it was determined to build the Magnolia improvement, the railroad began to open the neck of the bottle.

"The east end of the Cumberland Division of the Baltimore & Ohio Railroad is known far and wide in railroad circles as the most congested stretch of railroad line in the United States. Two main lines, one from Chicago, the other from St. Louis, converge at Cumberland, with the bulk of their tonnage gathered from innumerable sub-main and branch lines. Most of this business is for seaboard movement to Washington, Baltimore, Philadelphia, New York or New England. The question of keeping the trains moving with sufficient regularity to avoid blockades has long been one of moment and a problem calling for the most efficient operating methods.

"The daily average train movement over the line is eighty-five trains of all classes, consisting of fast and local passenger trains, through, local and pick-up trains, and numerous work trains and contractors' equipment, and of this there is an average of seventy freight trains daily. Another factor in the operation of the line under conditions prevailing before the improvements were undertaken was the diversity of traffic, both with respect to volume and class of business, and many incidents occur which tend to bring on an abnormal movement of one grade or other of traffic.

"While it has not been fully decided how the new line shall be used, it is generally believed that the two new tracks will be devoted to eastbound trains, and the old line turned over exclusively to westbound trains, this being the original idea when the line was surveyed.

"So quietly has work progressed upon the cut-off that traffic upon the old tracks has not been at all interrupted and, by day and by night, the passengers on local and limited trains have been swept past the scene of the big improvement for the most part unmindful of the task the engineers have forged to a successful conclusion.

"The greater part of the excavating has been done through solid rock. The slopes of the embankment, at river approaches, have been protected by concrete retaining walls, and the slopes along the hillsides terraced to obviate all danger from slides or falling rock.

"The improvement has cost approximately $6,000,000 and the operations have extended over a period of fourteen months."

ORGANIZATION NOTES.

Annual Meeting of the American Electric Railway Association.—The annual convention of the American Electric Railway Association was held at Atlantic City, from the 12th to the 16th of October. This organization is rapidly growing in importance as the electric railway industry is reaching that stage of development entitling it to the rank of a public utility of the first order. The industry has reached the stage where it is now engaged in perfecting its organization and putting into general practice those methods of operation that sufficient experience has approved as most desirable. For this reason the annual meetings of the national association are becoming more important. The membership at the present time includes over four hundred companies and represents 36,500 out of a total of 43,100 miles of track.

October Meeting of New York Railroad Club.—The October meeting of the New York Railroad Club was held on the 16th inst., and was addressed by Mr. O. O. Dixon, assistant engineer of the Interborough Rapid Transit Company, who presented a paper on "Distinctive Features of Track Equipment of the New York Subway."

Third Annual Safety Congress.—The National Council for Industrial Safety will hold its Third

Annual Safety Congress at the Hotel La Salle, Chicago, on October 13th to 15th, inclusive. A number of interesting addresses will be delivered on various phases of the safety movement, some of which will be illustrated by the employment of moving pictures. The Pacific Electric Railway Company of Los Angeles, Cal., will present a series of moving pictures for the purpose of demonstrating the safe and unsafe practices on interurban electric railways. Another illustrated lecture which should prove of interest to railway officials, will be that presented by Doctor F. D. Patterson, of J. G. Brill Company, Philadelphia, on "The Safe and Unsafe Practices in Shops."

The afternoon of October 15th, will be largely devoted to transportation, and will include an address by Chairman Insull, of this section, on "Safety as a Means of Bettering the Relations Between the Public and Public Service Corporations," and another by W. B. Spaulding, chairman of the Central Safety Committee of the St. Louis and San Francisco Railroad on "The Safety Problem of the Railroads."

The National Council for Industrial Safety has been organized with the avowed purpose of producing a maximum reduction in the enormous annual toll exacted through all classes of accidents in the United States.

In the industries of this country alone there is an average of more than 2,000,000 serious accidents every year. From experience, safety engineers are aware that at least fifty per cent of these can be avoided; and the National Council has pledged itself to use every known agency to co-operate in reducing these to the least possible figure. More than 35,000 of such accidents prove fatal every twelve-month; and on this basis safety experts figure that more than 17,000 valuable lives can be saved each year.

The National Council is a non-profit organization whose affairs are conducted by an Executive Committee and officers constituting a strong body of safety experts; and among its rapidly increasing membership are included corporations and companies whose names are household words from the Atlantic to the Pacific coasts.

It has established Local Councils in various sections of the country; and through these, and from its headquarters in the Continental and Commercial Bank Building, it is conducting a comprehensive campaign of Accident Prevention in all phases of Industrial, Public and Private life.

It maintains a general and specific Accident Prevention Service for its members in the wide dissemination of all the tested plans, methods and ideas which cut down casualties of whatever nature. On safety subjects it facilitates the use of motion picture films, stereopticon slides and lectures. It is conducting important and far-reaching investigations through its several committees. It is now arranging for the efficient testing and examination of all classes of safety devices and guards. It will shortly issue a handbook on safety for children entitled "Sure Pop and the Safety Scouts," which prominent educators have characterized as a monumental work, and one which will find a place in almost every school of the country.

Annual Meeting of the Railway Financial Officers.—At the annual meeting of the Society of Railway Financial Officers, held at the Hotel Aspinwall, Lenox, Mass., September 15th, 16th and 17th, the following officers were elected:

Executive Committee.—(With terms expiring 1916)—F. H. Hamilton, Secretary and Treasurer, St. Louis & S. F. R. R.; C. W. Rhoades, Assistant Treasurer, Baltimore & Ohio R. R.; H. E. Suckling, Treasurer, Canadian Pacific Ry.; A. O. Wellman, Assistant Treasurer, The A. T. & S. F. Railway.

Officers for the Next Year.—President, A. O. Wellman, (Asst. Treas., The A. T. & S. F. Ry.); First Vice-President, J. G. Stidger, (Treas., Wheeling & L. E. Ry.); Second Vice-President, C. W. Rhoades, (Asst. Treas., Balt. & Ohio Ry.); Secretary and Treasurer, Carl Nyquist, (Asst. Secy., The C. R. I. & P. Ry.).

The Society had a well attended and instructive meeting taking up among other things the matter of uniform form of vouchers and agents' drafts, general railway clearing-house, loose-leaf systems for treasury department records, methods of paying large shop forces, freight collection bureaus in large cities and items of general interest.

Mr. Louis B. Franklin, vice-president of the Guaranty Trust Company of New York, addressed the Society on the subject of "The Effect of the War on American Railroad Bonds."

The time and place for the next annual meeting of the Society will not be decided until after the first of the coming year.

The Traveling Engineers' Convention.

THE Traveling Engineers held a convention in Chicago, last month, which was notable for the thorough manner in which the various topics were handled by those present, and a larger number actively participated in the discussions than at any previous convention. The discussion on smoke prevention brought out the fact that great progress has been made in this particular, and that instead of being an impossibility, smokeless firing is now merely a matter of skill and care, particularly the latter.

One of the most important reports of the meeting was on "Operation of All Locomotives with a View of Obtaining Maximum Efficiency at Lowest Cost," presented by a committee of which Mr. I. K. Scott was chairman, assisted by Messrs. P. J. Miller, J. J. McNeill, W. L. Robinson, C. W. Hyde, F. W. Edwards, M. H. Haig and G. W. Tawse. It would be difficult to name an important subject connected with locomotive operation that this report failed to cover and to throw new light thereon. Realizing the magnitude of their subject, the committee circumscribed the investigation to certain prime factors as follows:

"1. Assignment and distribution of power.

"2. Classified or general repairs, when and how made.

"3. Location, application and operation of lubricators, injectors and other boiler attachments.

"4. Terminal inspection and maintenance of locomotives.

"5. Superheaters, brick arches, their care, operation and maintenance.

"6. Selecting, employing, promoting, examining and instructing engineers and firemen with a view of securing and maintaining good service.

"7. Terminal and road facilities for turning and prompt handling of power.

"8. Handling and firing locomotives with a view of obtaining maximum efficiency.

"9. Heat, steam, power and time that is wasted and how to avoid it."

It is hardly necessary to state that in the thorough discussion which occurred with regard to these various factors, little of importance was left out in connection with locomotive management.

Bi-Monthly Meeting of Pittsburgh Traffic Club.—The Traffic Club of Pittsburgh held their bi-monthly dinner and business meeting in the English Room of the Fort Pitt Hotel, Monday, October 12th, more than 150 being in attendance. Pictures showing progress in the construction of the Panama Canal were used to illustrate a talk by H. B. Furlong, of the McClintic Marshall Construction Company. The pictures were highly instructive as they featured the prominence of the material furnished by the State of Pennsylvania which was 85 per cent of the total, 75 per cent of which came from the Pittsburgh District. President E. F. Lalk presided and delivered an address. Mr. Furlong presented President Lalk with a lignum vitae gavel to remain in possession of the organization. The gavel was made from wood of a tie laid in 1852 as part of the original construction of the Panama Railroad. An excellent musical program was provided. Chairman R. B. Merrick and his committee handled the affair in excellent manner.

Annual Meeting of the Railway Signal Association.—The following synopsis of the 19th annual meeting of the Railway Signal Association which was held at Bluff Point, New York, on September 21-24, inclusive, was specially prepared for the "Railway World" by Mr. F. P. Patenal, signal engineer of the Baltimore and Ohio Railroad, and also president of the Association.

This meeting was the best attended in the history of the Association, and as the success of the meetings depends on the attendance, it was considered that this was one of the most successful meetings ever held.

The Board of Direction held its meeting on Monday, September 21st, for the purpose of winding up the business of the Board for the fiscal year 1914.

Session on Tuesday opened at 10 A. M., presided over by F. P. Patenall, signal engineer, B. & O. System, president of the Association.

Manager Thieriot of the D. & H. hotels and dining cars in an address of welcome handed over the keys of the Hotel Champlain to the members of the Railway Signal Association.

This was followed by the president's address.

Reports were presented by the Secretary and the Board of Direction covering the standing of the Association and business transacted during the year.

The following committee reports were then considered and discussed:

Committee No. 1—Signaling practice.
Special Committee—Method of Recording Signal Performance.
Committee No. 10—Storage Battery and Charging Equipment.
Special Committee—Lightning Protection.
Committee No. 9—Wires and Cables.
Committee No. 3—Power Interlocking.
Committee No. 4—Automatic Block.

In connection with the report of Committee No. 4, a minority report was made by G. H. Dryden, which proved to be of considerable interest, in that the chairman outlined practices which shows great progress in the Automatic Signaling for Single Track Railroads.

On Wednesday, September 23rd, the following reports were considered:

Committee No. 6—Standard Designs & Circuit Nomenclature.
Committee No. 8—Electric Railways & A. C. Signaling.
Special Committee—Amendments to the Constitution.

The annual dinner of the Association was held on the evening of Wednesday, September 23rd, and was one of interest, the attendance being 422. President F. P. Patenall acting as toastmaster, addresses were made by the following gentlemen:

Mr. C. S. Sims, vice-president, Delaware & Hudson Railroad.
Mr. A. H. Rudd, signal engineer, Pennsylvania Railroad.
Mr. T. S. Stevens, signal engineer, Atchison, Topeka & Santa Fe.

A most enjoyable evening was spent, the dinner course being interspersed with laughable situations introduced in the reading of messages received by the toastmaster bearing on current topics.

On Thursday, September 24th, the following reports were submitted and discussed:

Special Committee—Contracts.
Committee No. 2—Mechanical Interlocking.
Committee No. 5—Manual Block.
Special Committee—Signaling Requirements of Electric Railways.
Miscellaneous Business—

At the conclusion of the regular business on this day (September 24th) announcements were made as to the result of the letter ballot and the election of officers for the year 1915, which were as follows:

For President, Mr. Thomas S. Stevens, signal engineer, Santa Fe System; for Junior Vice-President, Mr. C. A. Dunham, signal engineer, Great Northern Railway; for Secretary-Treasurer, Mr. C. C. Rosenberg, Bethlehem, Pa.

The Junior Vice-President for the year 1914 automatically becomes Senior Vice-President for the year 1915, and Mr. W. J. Eck, signal engineer, Southern Railway, succeeds to the position vacated by Mr. T. S. Stevens to the presidency.

The ladies attending the Convention found ample entertainment in the way of tennis, golf, croquet, swimming, boat trips on the lake and a trip to Ausable Chasm.

The 1915 annual meeting is to be held at Salt Lake City.

Annual Convention of Passenger and Ticket Agents.—The American Association of General Passenger and Ticket Agents held its annual convention in Boston on September 15th to 16th. It was decided to change the name of the Association to the American Association of Passenger Traffic Officials. The meeting as a whole was characterized by a general effort for greater economy.

A report was submitted by the Committee on Economies on the distribution of folders and the Committee was continued with instructions to carry on its investigation. The recommendations of the Committee included a continuance of the present method of distributing folders in a modified form and it was also recommended that the placing of folded boxes in hotels and cities of less than 50,000 inhabitants, be discontinued. Closer co-operation with the Official Guide in this particular was recommended and the discontinuance of the distribution of folders on trans-Atlantic steamships was also urged for the reason that the Official Guide would answer the requirements of the ocean traveler.

The question of maintaining city ticket offices in foreign territory where the lines do not have initial rails was thoroughly discussed and a committee appointed to further investigate the subject. There appears to be an opportunity for a great saving in this direction.

The Committee on Limitations of Local Tickets reported that the new multi-route tickets of horizontal and vertical forms have now received the endorsement of the Association and a number of roads are experimenting with these forms in order to determine which of the two will be most convenient and effective. By their employment it is hoped to reduce coupon ticket form representation by thirty-three and one-third per cent.

Addresses were presented by the representatives of other associations, as follows: A. J. Gillingham, auditor of passenger traffic, Pennsylvania Railroad, representing the American Association of Accounting Officers; George A. Morton, general baggage agent, New York, New Haven & Hartford, representing the American Association of General Baggage Agents; George J. Alexander, president of the Canadian Ticket Agent's Association; Frank J. Burke, ticket agent at the Union Station, Chicago, representing the International Association of Ticket Agents, and H. M. Fletcher, passenger agent, Atchison, Topeka & Santa Fe, representing the American Association of Traveling Passenger Agents. An address was also presented by E. E. Clark, of the Interstate Commerce Commission on "American Passenger Service." Howard Elliott, chairman of the New York, New Haven & Hartford, also presented an address on the Natural Advantages and Summer Traffic of New England. Those in attendance at the convention were taken on an inspection trip over the electrified zone of the New York, New Haven & Hartford, between New York and New Haven, accompanied by General Manager Bardo nd Consulting Engineer Murray, who explained the principal features of the work.

Officers were elected as follows: President, Gerrit Fort, passenger traffic manager, Union Pacific, Omaha, Neb.; vice-president, Alexander Hilton, passenger traffic manager, St. Louis & San Francisco, St. Louis; secretary, W. C. Hope, general passenger agent, Central Railroad of New Jersey, New York. The next convention will be held at San Francisco in 1915.

Railway Painters Hold Annual Meeting.—The Master Car and Locomotive Painters' Association held its 45th annual convention at Nashville, Tenn., September 8th to 11th, inclusive, 292 members being present. The committee reports included the following subjects:

Tests; Finishing Steel Passenger Equipment; Interior Wood Finish for Passenger Coaches; Paint Shop Apprentice System; The Sand Blast as a Paint Remover and Standard Freight Car Lettering. Other papers were presented on Rust Inhibitive Paint and Non-Whiting Varnish for Locomotive Tenders.

Roadmasters' Annual Convention.—The Roadmasters' and Maintenance of Way Association of America, held its 32nd annual convention in Chicago, on September 8th to 11th, inclusive. Two hundred and twenty-five members were present. Committee reports under the following heads were presented and discussed:

New and Improved Track Tools; Proper Method of Rail Renewal; Proper Organization on Economical Use of Labor and Material; Proper Type of Track Accessories and Clearing and Policing the Right-of-Way.

Chicago was again selected for the 1915 convention.

The election of officers resulted in the choice of the following: President, P. J. McAndrews (C. & N. W.), Belle Plaine, Ia.; first vice-president, Coleman King (Long Island), Jamaica, N. Y.; second vice-president, M. Burke (C. M. & St. P.), Chicago; secretary and treasurer, L. C. Ryan (C. & N. W.), Sterling, Ill.; W. H. Kofmehl (C. M. & St. P.), Elgin, Ill. was elected a member of the Executive Committee for the full term of three years, and A. Grills (G. T.), St. Thomas, Ont., was elected to fill the vacancy on the Executive Committee caused by the election of Mr. McAndrews to the presidency.

The meeting of the Track Supply Association held in connection with the convention showed that organization to be in a flourishing condition. The officers for the past year have been: President, Walter H. Allen, Pennsylvania Steel Company; vice-president, E. M. Fisher, Fairbanks, Morse & Co.; secretary-treasurer, W. C. Kidd, Ramapo Iron Works, and members of the Executive Committee, Henry Fisher, Verona Tool Works, and L. P. Shanahan, American Steel & Wire Company. The exhibit in the corridors of the hotel was larger than ever and as in the past, was exclusively an exhibit of track appliances.

At the annual meeting held on September 10th, the following officers were elected for the ensuing year: President, E. M. Fisher, Fairbanks, Morse & Co.; vice-president, F. A. Preston, P. & M. Company; secretary-treasurer, W. C. Kidd, Ramapo Iron Works; director for one year, L. P. Shanahan, American Steel & Wire Co.; director for two years, R. A. Van Houten, Sellers Manufacturing Company.

TRAFFIC.

Efforts to Increase Revenues.—The railways of the United States are planning to launch a comprehensive movement for increases of revenues in all branches of their service following

President Wilson's recommendations that the railroads should be helped in every way possible in the present crisis.

Steps which are to follow as quickly as they can be worked out are:

"A general increase in passenger rates wherever practicable.

"Appeals to the Legislatures of the various States to repeal the full crew laws.

"Elimination of all free services and the making of charges for services rendered.

"Sale of properties not used or needed in transportation purposes."

"To contest in the Federal courts the right of State Commissions to compel the carriers to make allowances to the so-called tap or terminal lines, which allowances are characterized as 'rebates' by the Interstate Commerce Commission, and which are virtually directed to be abolished by that body.

"The repeal of the New Jersey grade crossing law.

"Restriction of free passenger transportation.

"The repeal of the two-cent fare laws in those States where such legislation is still in force.

"The repeal of other legislation which railroad officials regard as peremptory laws and which are not regarded as necessary as other legislation."

The Panama Exposition and the European War.—It was feared for some time after the declaration of the European war, that its influence would seriously cripple the success of the Panama-Pacific International Exposition, in that many of the foreign countries would fail to participate in this great event. The Fair authorities, however, although at times under considerable pressure, refused to postpone the Exposition and the wisdom of their decision is daily becoming more manifest. Not only will many European nations be represented at San Francisco, but out of forty foreign governments which have committed themselves to participate, not one has withdrawn. As a matter of fact, so rapid has been the recent progress in the construction of the city of foreign government pavilions and palaces, that each of them appears to be making an extra effort to surpass his neighbor.

A clearing house for travelers in San Francisco and other nearby cities during the Panama-Pacific International Exposition is represented in an organization being perfected by the Travelers' Aid Society of California. It is the aim of the Society to have trained workers meet every train and boat and give care, advice, assistance and—where welcome—protection to travelers, especially unescorted women and girls. To an information bureau, it will add a social service organization, if successful in its present plans. The California Society is modeled after that of New York which has assisted thousands of women and children annually, preventing not only inconvenience, but in many cases something worse. Moral protection will be one of the features of the 1915 exposition.

Isthmian Rail Traffic for the Fiscal Year.—The value of merchandise passing between New York and other Atlantic coast ports to San Francisco and other Pacific coast ports via the Panama Railroad has exhibited marked fluctuations during the last forty-five years, and with the opening of the Panama Canal to the traffic of the world has practically ceased to be a factor in the interchange of goods between the east and west coast sections of the United States.

In 1869, $70,000,000 worth of American products was moved across the isthmus via the Panama Railroad. In 1879, a decade after the opening of the first great transcontinental railway, the total dropped to $5,000,000, and by 1889 had further decreased to $3,000,000 in value. In the period from 1900 to 1906, during which time this transisthmian traffic was restricted by competition from the great coast-to-coast railways of the United States, but antedating the opening of the Tehuantepec Railway in Southern Mexico, the value of American merchandise moved over the Panama line gradually increased until it reached eight and one-half million dollars in 1902, receding again to five and three-quarters millions in 1906.

The Tehuantepec Railway was opened to traffic on January 1, 1907, and its influence on shipments via the Panama Railway was immediately reflected in the final figures for that year. For the entire fiscal year which ended June 30, 1907, the value of merchandise moving between New York and other Atlantic ports and San Francisco over the Panama Railroad was five and one-half million dollars, while for the last half of that year the value moved over the Tehuantepec line, including Hawaiian shipments, was over eleven million dollars. In the period from 1907 to 1913 traffic over both lines increased, domestic shipments via Panama showing a total of eighteen millions and those via Tehuantepec ninety-four million dollars. These figures are exclusive of American shipments to foreign countries, which included twelve million via Panama and six and one-half million via Tehuantepec in 1913.

In the fiscal year 1914, the value of domestic traffic moved over the Panama line was twenty-one million dollars, while that via Tehuantepec decreased to sixty-seven million, this falling off being due, in part, to the war in Mexico in the latter part of 1913. Shipments to foreign countries via the Panama line aggregated thirteen and one-half million and those via the Tehuantepec Railroad, six million.

Express Companies to Assist in the Development of South American Trade.—The American Express Company believing the commercial interests of the country to be particularly interested at the present time in the development of trade with South America, have taken the occasion to invite specific inquiries from exporters and importers with respect to exports or imports of Brazil, Argentina, Uruguay, Chili and Peru. This same Company has arranged to send two special representatives to these countries to make a careful and painstaking investigation of the opportunities for the extension of American business generally in South American fields. Both representatives have had many years' experience in their respective branches of foreign trade and are competent to deal with the questions arising in connection therewith.

Exporters and importers generally may avail themselves of the services of these men, who will give attention, in so far as may be practicable, to any inquiries within reasonable scope relative to foreign trade matters and conditions at the points they may visit. Communications on this subject should be addressed to the American Express Company, South American Department, 65 Broadway, New York.

Southern Railway Reduces Ticket Collectors on Passenger Trains.—On account of decreased passenger revenues due apparently to uncertainties occasioned by the European war, Southern Railway Company has decided to temporarily reduce to a minimum the number of ticket collectors employed on its passenger trains. This arrangement became effective October first.

LEGAL.

Important Recent Federal and State Legal Decisions Affecting the Carriers.

THE following analysis of the more important Federal and State Court decisions rendered during September and which relate to the operation, management and regulation of the railroads of the United States, constitutes a continuation of the record began in the July issue of the "Railway World." As is apparent, the necessary reference to Court records and authorities is given in each case and any further information desired, will be furnished upon request. Suggestions regarding these records will be gladly received as an effort is being made to make them of practical value to the legal departments of the various railways.

The Hours of Service Law.—(Federal, Western Washington.) The Federal Hours of Service Law provides that train crews shall have eight consecutive hours of rest in every twenty-four hours, except in case of casualty or unavoidable accident. Under this law a railroad company is not liable to prosecution where one of its train crews, through the happening of a serious accident to another train, was delayed and unable to make its run within the sixteen-hour period. The United States Circuit Court of Appeals at Seattle, Washington, has held the railroad company not liable, saying that the case comes within the exception of the law in case of casualty or unavoidable accident.—(United States v. Northern Pacific Railway Co., 215 F. 64.)

Icing Charges.—(Federal, Chicago, Illinois.) Where an interstate carrier published and filed with the Interstate Commerce Commission a tariff sheet, covering icing charges providing that the carrier, when requested, would furnish refrigeration, charging therefor the "actual cost including labor, but not less than $2.50 per ton of 2,000 lbs." it was held that though the provision for charging the actual cost was void for uncertainty, such invalidity did not invalidate the charge, and hence the carrier was entitled to charge $2.50 per ton.—(Cudahy Packing Co. v. Grand Trunk Western Ry., 215 F. 93.)

State Regulation of Railroad Rates.—(Federal, Eastern Arkansas.) Where a railroad company incorporated under the laws of a state has built and economically operates its lines of road, it is entitled to earn at least sufficient to pay operating expenses, and a law of the state which will not permit it to do so is confiscatory. On application of the railroad company for an injunction to restrain the enforcement of such a rate fixed by statute the court may exercise its discretion as to granting the same. The fact that the company did put the rate into effect and was unable to meet the necessary operating expenses should have some weight in the exercise of such discretion.—(Bellamy v. Missouri & N. A. R. Co., 215 Fed. 18.)

Liability for Injury to Employe.— (Federal, Eastern Kentucky.) Where a railroad company validly leases its lines to another railroad, the lessor company is not liable as an employer for injuries caused to employes of the lessee company by the latter's negligence.—(Gibson v. Chesapeake & O. Ry. Co., 215 Fed. 24.)

Persons on Track.—(Federal, Tenn.) Where decedent was discovered on the track by defendent's brakeman on the approaching train at the full distance ahead for which physical objects permitted a view of the track, and every possible means to stop the train was not immediately taken as required by Shannon's Code, Tenn., and decedent was struck and killed, the railroad company was liable.—(Cincinnati, N. O. & T. P. Ry. Co. v. M'Intyre, 215 Fed. 91.)

A Question of Damages.—(Federal, Cleveland, Ohio.) Where, in an action for injuries to a railroad brakeman under the Federal Employers' Liability Act, the court charged that if plaintiff's negligence was as great as the negligence of defendant there might be an equality of negligence, and therefore no substantial recovery of any amount of damages could be had, defendant was not prejudiced by another instruction that plaintiff's recovery, if any, should be reduced by such an amount as the jury found the negligence attributable to him bore in proportion to the negligence of defendant company, in that the latter might be construed to mean that if plaintiff was found twice as negligent as defendant he would recover one-half his damages.—(Penn. Co. v. Cole, 214 Fed. 949.)

No Recovery for Mental Suffering.—(Federal, Seattle, Wash.) The Statute of the State of Washington authorizes parents to recover for the wrongful killing of a minor child such damages as to the jury shall seem just under all the circumstances. Section 194 provides that no action for personal injury to any person, occasioning his death, shall abate, if he have a wife or child living or, leaving no wife issue, if he have dependent on him for support and resident within the United States at the time of his death, parents, etc., who are authorized to sue. Section 184 declares that a father, or, in case of his death or desertion of his family, the mother, may obtain an action as plaintiff for the death of the child. Held, that under such statute no recovery can be had by a parent for mental suffering, pain, and anguish sustained and suffered as the result of the wrongful killing of a minor child, but the damages are limited to the pecuniary loss resulting from such death.—(Penoza et ux. v. Northern Pac. Ry. Co., 215 Fed. 200.)

Duty to Operate Road.—(Federal, Southern Iowa.) While as a general rule it is the duty of a railroad company to maintain its entire line of road in a reasonably safe and operative condition, and to operate the same, there may be conditions which will excuse the full performance of this duty, and justify the abandonment of a branch or connecting line which cannot be operated without great loss and for which there is no great public necessity. Defendant railroad company owned and operated an electric line of road 125 miles long which was of large public importance. It also owned and operated by steam a connecting line 27 miles long which was not equipped for operation by electricity. This line was little used and there was little public necessity for its operation. It did not pay operating expenses, was in a dilapidated and dangerous condition for use, and required the expenditure of a large amount of money to rehabilitate it. Defendant was hopelessly insolvent, and a suit for foreclosure of mortgages on its property was pending in which receivers had been appointed who had operated the steam line at a large loss, and under an order of the court had tried unsuccessfully to sell the same. Neither defendant nor the receivers could obtain the money necessary to put it in safe operative condition and to require its operation by any purchaser of the entire property would seriously embarrass, if not prevent, the successful operation of the electric line. Held, that under such conditions neither defendant nor a purchaser was under the duty to continue to operate such line.—(State of Iowa v. Old Colony Trust Co. of Boston, 215 F. 307.)

Tunnels Not Taxable.—(New York.) Tunnels attached to the power house of a rapid transit railroad where the right to construct a tunnel is based solely on the ownership of the fee in the land through which it is built, are not taxable as a special franchise.—(Interborough Rapid Transit Co. v. Purdy, 148 N. Y. S. 1074.)

Reservation in Grant to Railroad Company.—(New York.) The rule that if one conveys land, leaving other land belonging to him to which he can have access only by passing over the land granted, a way of necessity is reserved in the grant obtains though the grant is for a railroad right of way.—(Heaton v. New York Cent. & H. R. R. Co., 149 N. Y. S. 71.)

Rights of Stockholders.—(New York.) Under its articles of association providing that, after the prescribed dividend is paid on the preferred stock, it is entitled to no further share of the profits, an extra dividend declared by a railroad company after payment of the preferred stock dividend held to belong to the common stockholders, so that the preferred stockholders did not have the right to participate therein.—(United States v. Union Pac. R. Co., 212 N. Y. 92.)

Death of Railroad Engineer.— (Connecticut.) Where an experienced locomotive engineer who was familiar with engines and tenders and their proportions, and who, not only by reason of his frequent and recent service over the portion of the road where he was killed by coming in contact with an electric wire while passing from the cab over the top of the tender in the course of his duties at an overhead bridge where the wire was necessarily lower than usual, but by reason of special notices given him, knew and appreciated the danger, he assumed, by continuing in his employment, those risks connected therewith which had remained unchanged and unenhanced by any new and negligent act of defendant; and hence there could be no recovery for his death.—(Farley v. New York, N. H. & H. R. R. Co., 91 A. 650.)

Condemnation of Railroad Right of Way.—(Pennsylvania.) It is essential to the condemnation of land for a railroad right of way that there shall be a preliminary survey made and reported with necessary maps and profiles, and the selection and adoption of a surveyed line by the directors for the location of the proposed railroad, and that the owner shall be compensated for damages sustained.—(Johnston v. Delaware, L. & W. R. Co., 91 A. 618.)

Readjustment of Rates.—(Nebraska.) Evidence that rates charged by a railroad company for shipments to a particular point are higher than rates charged between the initial points and two other points will not of itself support a finding and order reducing and readjusting the rates. It must be alleged and proved that the rates complained of are unreasonble, unjust, or discriminatory.—(Byington v. Chicago, R. I. & P. R. Co., 148 N. W. 148.)

Injury Caused by Broken Rail.—(Oregon.) In an action for injuries to a passenger, an instruction to the jury that a railroad carrying passengers is not an insurer against accident nor responsible for accident which is unavoidable, but is held to the utmost care which can be exercised by human prudence, skill, and diligence, is not error.—(Graham v. Corvallis & Eastern R. Co., 142 P. 774.)

Federal Employers' Liability Act.—(Oregon.) An action for an injury to a brakeman in a switching crew, whose general duties were to use a locomotive in moving indiscriminately cars used in local traffic and those carrying goods destined to and received from other states, the injury having occurred when plaintiff was coupling the locomotive to a private car used wholly within the state, is within the Federal Employers' Liability Act (35 Stat. 65), relating to the liability of common carriers engaged in commerce between any of the several states to persons injured in their employ.—(Oberlin v. Oregon-Washington R. & Navigation Co., 142 P. 554.)

Snow Slide in Cascade Mountains.— (Wash.) One of defendant's passenger trains over the Cascade Mountains became stalled in a snowstorm and was blocked for some days on a passing track constructed at the west end of a tunnel along the mountain side, and, while in such position, was carried down the mountain by an avalanche and destroyed and decedent and other passengers killed and injured. Held, that defendant was not guilty of negligence concurring with the act of God in adopting the shelf along the mountain side for its roadbed, in failing to construct a snowshed over its tracks, in taking the train through the tunnel and placing it on the passing track on the mountain side, in failing to move the train under snowsheds, in failing to move it back to spurs opposite a flat area, in failing to move it into the tunnel, or in failing to notify passengers on or before the time of the accident that it did not intend to move the train from the mountain side, instead of leading them to believe that it might start for its destination at any time.—(Topping v. Great Northern Ry. Co., 142 P. 424.)

LEGISLATION.

Effort to Repeal Pennsylvania's Extra Crew Law.—President Rea, of the Pennsylvania Railroad has appealed to the people of Pennsylvania to ask their representatives in the next legislature to repeal the Extra Crew Law. Mr. Rea's appeal, which has been posted in all stations on the railroad and on all employes' bulletin boards, reads as follows:

"It is in the interest of the public—whose chief concern is good service and safety—that the Extra Crew Law now on the Statute books of Pennsylvania and other States be repealed.

"This law causes a waste of $1,100,000 annually in the employment of unnecessary men on the Pennsylvania System alone.

"No one is more concerned than the Pennsylvania Railroad Company in securing maximum safety on its lines. Every train on this Railroad has a full crew, and this extra expenditure adds nothing to safety or public convenience. The same money had much better be spent to remove grade crossings, improve tracks, signals, and bridges, and buy steel cars.

"This Extra Crew Law, which compels unnecessary expenditures, is one of the factors which menaces the ability of this Company to pay present rates of wages to that great body of employes whose activities are needed.

"The Public Service Commission should see to it that all trains are properly manned. Such action would amply protect employes and the public.

"We appeal to the people in their own interest, we appeal to our employes in their best interest, to ask their representatives in the next Pennsylvania Legislature to repeal the Extra Crew Law.

"SAMUEL REA, President,
"Pennsylvania Railroad Co."

Progress in Anti-Trust Legislation.—Two of the three measures constituting the administration's anti-trust program, have been concluded. These are the Federal Trade Commission Act and the Federal Anti-Trust Bill. The remaining measure, known generally under the designation of the "Bonds and Stocks" bill, has been put aside until the next session of Congress, when, it is understood, it will be taken up for consideration. It is also rumored in Washington that at the next session of Congress the party now in power will undertake to re-establish the Commerce Court, recently abolished, and that such court, if reestablished, will instead of holding its sessions only in Washington be authorized to sit at various important cities, among which are mentioned: San Francisco, Denver, Chicago, St. Louis, New Orleans, Cincinnati, New York, Boston and Washington. It is said that the idea of authorizing sessions of the court to be held in these various cities is for the benefit of the shippers, rather than for the convenience of the railroads.

RESIGNATIONS.

Executive.

Frank W. Blair, receiver, Pere Marquette Railway.

Legal.

Reuben A. Miller, chief counsel, Louisville, Henderson & St. Louis Railway.

Edward D. Robbins, general counsel, New York, New Haven and Hartford Railroad.

C. L. Sivley, general attorney, Illinois Central Railroad.

Accounting.

W. L. Bird, auditor, Norfolk Southern Railroad.

B. A. Neisser, freight claims auditor, Grand Trunk Railway.

H. L. Penny, general auditor, Canadian Pacific Railway.

Engineering and Mechanical.

K. E. Kellenberger, supervisor of signals, Chicago and North Western Railroad.

Harry G. Love, general car foreman, Chicago and Eastern Illinois Railroad.

Nelson M. Markley, superintendent of bridges and buildings, Peoria and Eastern Division, Big Four Railroad.

W. D. Minton, master car builder, Texas and Pacific Railroad.

F. M. Patterson, engineer, Missouri District, Chicago, Burlington and Quincy Railroad.

W. A. Rogers, master mechanic, Los Angeles Division, San Pedro, Los Angeles & Salt Lake Railroad.

E. A. Sweeley, supervisor of car repairs, Atlantic Coast Line.

W. H. Willis, signal engineer, Erie Railroad.

Operation.

George Crumbo, general foreman of shops, Chicago, Indianapolis & Louisville Railway.

William Downie, general superintendent, Atlantic Division, Canadian Pacific Railway.

George P. Johnson, general manager, Chesapeake and Ohio Railroad.

J. F. Jones, superintendent, Grand Trunk Railway.

M. E. Sebree, trainmaster, Cincinnati, New Orleans & Texas Pacific Railway.

John L. Terry, general manager, Denver, Laramie & Northwestern Railroad.

A. N. Williams, trainmaster, Missouri, Kansas and Texas Railway.

Traffic.

H. G. Alexander, district passenger agent, Chicago, Indianapolis and Louisville Railway.

O. C. Carter, general freight agent, Chicago, Indianapolis and Louisville Railroad.

H. A. Cooper, district passenger agent, Missouri Pacific-Iron Mountain System.

E. L. Dalton, general agent, traffic department, Minneapolis & St. Louis Railroad.

B. J. Libbe, general agent, freight department, Chicago and Alton Railroad.

F. P. Jeffries, general agent, Chicago and Eastern Illinois Railroad.

L. F. Malum, soliciting freight agent, Queen and Crescent Route.

B. M. Waldron, freight claim agent, Cincinnati, Hamilton and Dayton Railroad.

Purchasing.

Daniel Dowing, general storekeeper, Chicago and Alton Railroad.

George A. Secor, general storekeeper, Minneapolis and St. Louis Railroad.

ELECTIONS AND APPOINTMENTS.

Executive.

G. K. Keeks, president, San Francisco-Oakland Terminal Railways. Headquarters, Oakland, Cal.

T. J. Kennedy, president and general manager, Algoma Central & Hudson Bay and the Algoma Eastern Railroads. Headquarters, Sault Ste. Marie, Ont.

John Leslie, comptroller, Canadian Pacific Railway. Headquarters, Montreal, Que.

S. L. Schoonmaker, director, American Locomotive Company.

Frank Scott, vice-president, in charge of finances, Central Vermont Railroad.

David Van Alstyne, assistant to the vice-president in charge of operation, New York, New Haven and Hartford and the Central New England Railroads. Headquarters, New York.

J. A. D. Vickers, vice-president and general manager, American Express Company.

Felix M. Warburg, member of the Board, Baltimore and Ohio Railroad.

Legal.

Thomas Hackney, general attorney, Missouri Pacific and the St. Louis Iron Mountain and Southern. Headquarters, Kansas City, Mo.

James P. Helm, chief counsel, Louisville, Henderson & St. Louis Railway. Headquarters, Louisville, Ky.

Farrar L. McCain, general counsel, Midland Valley Railroad. Headquarters, Muskogee, Oklahoma.

E. G. Merriam, assistant general solicitor, Missouri Pacific-Iron Mountain System. Headquarters, St. Louis, Mo.

Thomas L. Phillips, valuation attorney, Missouri Pacific and the St. Louis, Iron Mountain and Southern Railway. Headquarters, St. Louis, Mo.

B. I. Spock, general solicitor, New York, New Haven and Hartford Railroad. Headquarters, New Haven, Conn.

E. J. White, general solicitor, Missouri Pacific-Iron Mountain System. Headquarters, St. Louis, Mo.

Financial.

S. N. Rice, assistant secretary and assistant treasurer, Missouri Pacific. Headquarters, New York.

H. L. Utter, secretary and treasurer, Missouri Pacific. Headquarters, New York.

Accounting.

L. A. Farquhar, auditor, Norfolk Southern Railway. Headquarters, Norfolk, Va.

J. R. McCoy, assistant auditor for receivers, Denver, Laramie & Northwestern Railway. Headquarters, Denver, Colo.

W. J. Moule, auditor of disbursements, Canadian Pacific Railway. Headquarters, Montreal, Que.

F. E. Shrimpton, general auditor, Canadian Pacific Railway. Headquarters, Montreal, Que.

J. B. Wagner, auditor, Toledo and Ohio Central Railroad. Headquarters, Toledo, Ohio.

Engineering and Mechanical.

J. Q. Anderson, roadmaster, Atlantic Coast Line. Headquarters, Petersburg, Va.

O. F. Barnes, division engineer, New York Division, Erie Railroad. Headquarters, Jersey City, N. J.

C. H. Blackman, principal assistant engineer, Louisville and Nashville Railroad. Headquarters, Louisville, Ky.

Elmer H. Brown, roadmaster, Northern Pacific Railway. Headquarters, Dilworth, Minn.

Arthur B. Caldwell, division engineer, Allegheny and Broadford Divisions, Erie Railroad. Headquarters, Salamanca, N. Y.

N. A. Camera, supervisor of Bellwood Division, Pennsylvania Railroad. Headquarters, Bellwood, Pa.

T. S. Davey, shop superintendent, Erie Railroad. Headquarters, Buffalo, New York.

Ransom L. Dyke, division engineer, New York Susquehanna and Western Railroad. Headquarters, Jersey City, N. J.

E. S. FitzSimmons, mechanical superintendent, Erie Division, Erie Railroad. Headquarters, New York.

Frank L. Fox, general foreman, car department, Pere Marquette. Headquarters, Detroit, Mich.

Charles James, mechanical superintendent, Ohio Division, Erie Railroad. Headquarters, New York.

Harold Knight, signal engineer, Erie Railroad. Headquarters, Jersey City, N. J.

W. S. Johns, Jr., supervisor, Division No. 21, Pennsylvania Railroad. Headquarters, Tyrone, Pa.

L. F. Lonnbladh, engineer maintenance of way, Missouri, Kansas & Texas Railway. Headquarters, Dallas, Texas.

William R. McMunn, general car inspector, New York Central and Hudson River Railroad. Headquarters, Albany, N. Y.

J. V. Mayhall, assistant storekeeper, Baltimore and Ohio Railroad. Headquarters, Parkersburg, W. Va.

M. A. Mulligan, general yard inspector, Lehigh Valley Railroad. Headquarters, South Bethlehem, Pa.

F. H. Murray, master mechanic, Erie Railroad. Headquarters, Jersey City, N. J.

E. H. Peck, engineer, Missouri District, Chicago, Burlington and Quincy Railroad. Headquarters, St. Louis, Mo.

W. W. Portzer, assistant supervisor, Middle Division, Pennsylvania Railroad. Headquarters, Mifflin, Pa.

A. E. Reid, supervisor of signals, Chicago and North Western Railway. Headquarters, Boone, Iowa.

L. D. Richards, master mechanic, Arkansas Division, Rock Island Lines. Headquarters, Little Rock, Ark.

Frank Ringer, engineer maintenance of way, Missouri, Kansas and Texas Railway. Headquarters, Parsons, Kansas.

William Schmalzreid, master car builder, Texas and Pacific Railroad. Headquarters, Marshall, Texas.

William Schuman, general foreman of shops, Chicago, Indianapolis and Louisville Railway. Headquarters, Lafayette, Ind.

George Searle, master mechanic, Los Angeles Division, San Pedro, Los Angeles and Salt Lake Railroad. Headquarters, Las Vegas, Nev.

G. A. Secor, general storekeeper, Chicago and Alton Railroad. Headquarters, Bloomington, Ill.

S. S. Senter, superintendent of bridges and buildings, Wheeling and Lake Erie Railroad. Headquarters, Brewster, Ohio.

W. H. Seward, assistant engineer, Chicago, Burlington and Quincy Railroad. Headquarters, St. Joseph, Mo.

O. E. Shaw, general car foreman, Chicago & Eastern Illinois Railroad. Headquarters, Danville, Ill.

W. H. Snyder, master mechanic, Erie Railroad. Headquarters, Stroudsburg, Penna.

George Strasding, roadmaster, Pasco Division, Northern Pacific Railway. Headquarters, North Yakima, Wash.

George Thibaut, master mechanic, Erie Railroad. Headquarters, Port Jervis, N. Y.

Paul A. G. Tolmot, roadmaster, South Bend and Grays Harbor branches, Northern Pacific Railroad. Headquarters, Tacoma, Wash.

A. G. Trumbull, general mechanical superintendent, Erie Railroad. Headquarters, New York.

C. M. Wester, storekeeper, Baltimore and Ohio Railroad. Headquarters, Parkersburg, W. Va.

William V. Wicks, road foreman of engines, Northern Pacific Railway. Headquarters, Jamestown, N. D.

J. H. Wood, supervisor of locomotive operation, Rock Island Lines. Headquarters, El Reno, Okla.

C. S. Yeaton, road foreman of equipment, Chicago, Rock Island and Pacific Railway. Headquarters, El Reno, Okla.

C. A. Zweibel, supervisor of car repairs, Atlantic Coast Line Railroad. Headquarters, Wilmington, N. C.

Railway World

VOL. LVIII. NOVEMBER, 1914 No. 11

Important Developments in the Transportation Field

FINAL ARGUMENTS IN ADVANCE RATE CASE

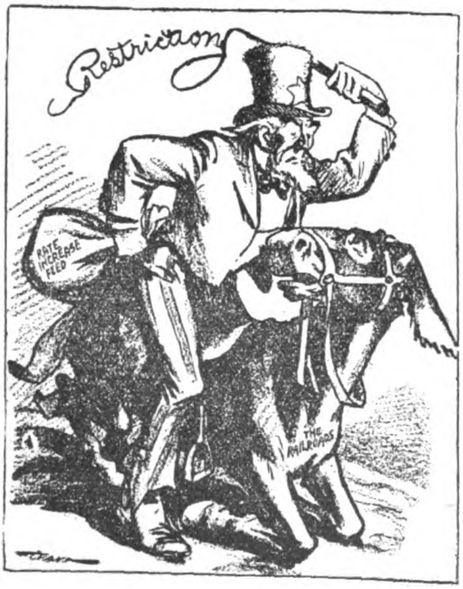
On October 30th, the final arguments in the so-called Eastern advance rate case were made. In view of the fact that the carriers' third appeal for relief was in the nature of a supplementary hearing, a quick decision was confidently expected. The Commission, however, believes in taking its time, even though the whole country is on edge awaiting the results of its conclusions. The railroads have presented such a strong case, however, that it is almost the universal belief that the decision when rendered, will be favorable. In the October issue reference was made to the opening address by President Daniel Willard, of the Baltimore and Ohio, and the statements made by Mr. George M. Shriver, vice-president of the same road, by Charles A. Conant, of New York, author of many authoritative works on finance; and to the letter sent by George B. Caldwell, president of the Investment Bankers' Association, to all the members of that organization, urging a hearty support of the railways' plea for an increase in rates.

Others who have since testified before the Commission include Mr. Samuel Rea, president of the Pennsylvania Railroad; Mr. Frederick Strauss, of the Investment Bankers' Association; Mr. O. E. Butterfield, assistant general solicitor of the New York Central Lines; Mr. George Stuart Patterson, general solicitor of the Pennsylvania Railroad; Mr. J. L. Minnis, general solicitor of the Wabash Railroad, and Mr. George F. Brownell, vice-president of the Erie Railroad.

Mr. Strauss had back of him a Bankers' committee, representing leading financial institutions in all sections of the country. He pointed out that the railway situation was particularly critical on account of recent war developments. We are a debtor nation and at the present time owe England about $250,000,000. To quote from the statement of Mr. Strauss:

> The great danger that lies before us is this: Up to the present time there has been a large investment in American securities abroad. The figures, Sir George Paish tells me, are, conservatively, six thousand million dollars, not a lesser amount, and the very large predominating majority of those are railroad securities.
>
> Sir George Paish thinks that England should continue to buy American securities, for the reason that, strange as it may seem, as he says, the greatest danger is by these defaults of the world over—Brazil, Argentine, Canada and Mexico, with a possibility of further defaults—the European investor may become so panic-stricken in regard to his investments that he will begin to hoard and the gold will disappear. If that happens, of course the whole civilized world is going to collapse immediately, so far as credit is concerned.
>
> If, however, American railroad securities will be accepted by the European investor as the one thing in which his savings are safe, the one thing that he can turn to, the great railroad trade of the world, which means most of our trade, because, while our trade has diminished, it will gradually increase, and even though less than formerly, it will be a large proportion of the world's trade—if such security can be created, giving British investors thorough confidence that the American railroad security is the only thing that offers him protection, the effect upon this country is going to be magical, whereas the opposite opinion would be disastrous.
>
> I believe that the mere granting of a five per cent increase in Official Classification territory will produce a very important effect in this respect, that it will cause the European and American investor, both, to believe that, in time of great emergency, the Interstate Commerce Commission

BALAAM AND HIS MULE



The Railroads—Say, how do you expect me to travel with you on my back and nothing in my stomach?
—From the *Baltimore American.*

GEORGE F. BROWNELL.

Vice-President, Erie Railroad, Who Delivered the Closing Address in Eastern Advance Rate Case.

will extend whatever protection lies within its power to the railroads to maintain their credit, and leave it to the future, if earnings under that ruling increase beyond reason, to make whatever reduction is then deemed wise and just, and if such a reduction be then made, I think it would produce a great deal more of confidence because the investor would know that at a time of emergency he would be protected.

Both as a matter of self-interest to the railroads and to the public, if money has gone honestly and with reasonably good judgment into a property the rates of which are regulated by public authority and over which the management has no control, so that its profits are more or less limited, I do believe any investor has a right to expect broadly speaking and not taking individual cases, that he shall have a continued return upon that investment.

He has not the opportunity to get, neither has the management to give him, extraordinary big profits in good years to compensate him for diminished profits in bad years. It has become, under Government regulation, a question of Government protection; not a guarantee, but certainly Government regulation implies Government protection.

It may be thought by those who take a narrow view of the subject that it is not a part of the duty of the Interstate Commerce Commission to concern itself with the prices of stocks or bonds. Whatever may be true in ordinary times, and in my judgment the Interstate Commerce Commission can never safely ignore this factor, under present conditions of stress and strain it is certainly the duty of the Interstate Commerce Commission to do everything in its power to prevent low prices of railroad and, indirectly, therefore, of other securities.

And I say "other securities" because the prices of other securities almost invariably take their tone from that of railroad securities. These furnish the standard of prices. If the prices of railroad securities are depressed, so will be those of other industries.

The country cannot prosper unless the railroads prosper. This is axiomatic; but at the present time it is truer than ever before. It is needless to point out that corporations seeking to finance themselves cannot sell their securities at prices above the market. It is, therefore, distinctly to the interests of all the people of this country, shippers and travelers and others, that the Interstate Commerce Commission should do everything in its power to maintain a high level of prices for railroad securities.

It may seem to the Commission that this is a very much overdrawn picture and that an increase of five per cent in rates to be charged by the roads in Official Classification territory cannot be the sole factor in determining whether this country is to proceed with the orderly re-establishment of its damaged credit and business structure, or whether everything is to go to ruin.

This is unquestionably so; but it is also true that the other remedial measures which may be necessary are not within the power of the Interstate Commerce Commission to grant or withhold. Further remedial measures will in my judgment have to be undertaken, some by the banking interests of the country, some perhaps by the United States Government, and some by the State Governments and public service commissions, but the only remedy that is within the power of the Interstate Commerce Commission to provide is a rate increase to the full extent asked for.

Railroad securities have so far fallen into disrepute that even receivers' certificates, until recently regarded as unassailable investments, have in some cases been renewed only by means of forced extensions.

The crisis is immediate and the remedy must be immediate also. It is of no use now to speak of economies of operation. These should be undertaken and must be undertaken in due course. Immediate relief, in part, lies within the power of the Commission to grant, and this, in my judgment, it ought to grant in order to re-establish confidence in American railroad securities and to check the further export of gold.

The closing argument for the carriers was made by Vice-President George F. Brownell, of the Erie Railroad, who spoke in part as follows:

I do, however, contend that in determining whether the carrier's charges for its transportation services are just and reasonable, the Commission have the right, and it is their duty to take into consideration, among other things, the adequacy of the net operating income derived therefrom, its sufficiency to enable the carrier properly to perform its important quasi-public functions. and to secure the new capital necessary therefor. and for the other related matters of public interest and welfare.

If there are several methods by which the Commission lawfully can enable the carriers to find relief from the existing inadequacy of their revenues and one of these methods will also promote the welfare of, or safeguard public or private interests, while the adoption of the other method will either not accomplish that result or be doubtful in its effect, then I say the Commission should take these matters into consideration and should adopt the method of relief which will inure to the benefit of all.

That a crisis now exists in the affairs of these railroads, and that their credit, seriously impaired, as we believe, before the war started, principally because of inadequate operating income, is now confronted by a grave emergency, would seem to be but plain truths.

The crisis which confronts the railroads has been emphasized, has been aggravated and has been made more clear and certain by the war, but the war does not constitute and did not alone create the existing crisis in our affairs. That crisis existed before the war and is reflected in the records of their operations and the long-continued increase in expenses and accompanying reduction in net revenues and income, whereby the railroad industry has been forced to become an industry of constantly decreasing returns.

In the majority report delivered bv Commissioner Harlan on the former hearing, it was stated that the credit of our railroads has undoubtedly suffered in recent years, but that this was largely from causes that were independent of their rates. The majority were inclined to attribute this loss of credit and impairment of the confidence of the public in the stability of railroad securities largely to the mismanagement of some great railroad systems of international repute, to the circumstances leading up to the appointment of receivers for certain other companies, to the interlocking of railroad systems with weak lines, and other causes not related to the adequacy of rates or revenues.

However, upon the rehearing it now appears by the uncontradicted testimony of Mr. Strauss and others, that in their opinion and in the opinion of others who are best qualified to judge, while the considerations referred to in the majority report have operated to a relatively slight extent, yet the principal cause for the impairment of railroad credit and the impaired confidence in the value and stability of railroad securities has been the inability of the railroad companies to increase their rates to the extent necessary to secure to them reasonably adequate net revenues.

The majority report of the Commission also made certain tentative suggestions as to measures which might be taken by the carriers to secure additional revenues and thereby "to meet the situation" otherwise than by resorting to a general advance in their freight rates.

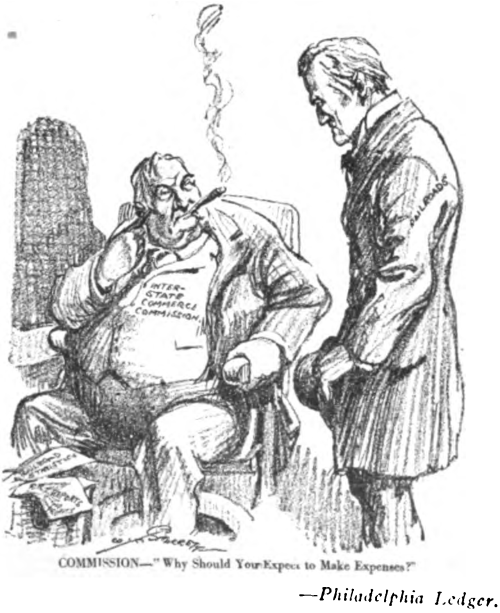
As shown in the carriers' petition and by the evidence of Mr. Willard and other witnesses, the carriers have given and are giving earnest attention to the recommendations and suggestions of the Commission in those regards, but one of the new factors in the case which we think the Commission should take into consideration is that the hopes of increased revenue from most of these sources, instead of having an early realization, will not end in fruition in time to afford a relief for the present situation and crisis, even though they happily may at some more remote period result in partial realization.

It is believed by those responsible for the management of the carriers that they cannot safely rely upon any expectation that the additional revenues which may ultimately be secured by the adoption of means other than a general advance in freight rates can be obtained in the near future; or that when secured any such additional revenues will be adequate to meet the reasonable needs of the carriers for increased revenues in the present situation.

We hope and believe that, upon all the facts which the whole record now contains, the Commission will find that the proposed rates are no more than just and reasonable and allow them to become effective, before it is too late; but in case the Commission determine to the contrary, should they not, in that event, as a matter of sound discretion (even if they are of opinion that the provision of the statute in that regard which I have quoted is not mandatory) adopt the course indicated by the statute, instead of requiring the carriers to await the outcome of the attempted application of the tentative suggestions as to substituted measures which might be taken by them to secure additional revenue? Would not that be the better, proper and safer course to pursue in such contingency—particularly in view of the fact that the carriers believe that what can be accomplished through such suggested substitute measures will be too inadequate in amount, and too remote in point of time, to provide necessary relief, and that the record justified that belief, and in view of the further fact that the carriers, and the great public and private interests dependent upon their future welfare, otherwise would be subjected to the great risk of such alternative measures proving to be inadequate or ineffective?

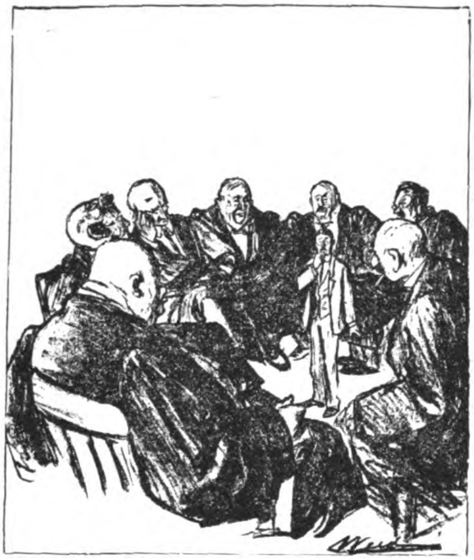
AN ANTAGONISTIC ATTITUDE

It is hard to understand why the Interstate Commerce Commission continues its apparently antagonistic attitude towards the carriers. Such an attitude might have been more readily understood in the past when the railways were more actively combating the Commission's authority. Within recent years, however, there has been evidenced a strong desire to work in harmony with the Commission and to abide by their decisions and rulings in all cases where it did not actually jeopardize the solvency of their properties. The Commission has, at times, recognized



COMMISSION—"Why Should You Expect to Make Expenses?"

—*Philadelphia Ledger.*



Commissioner (to Railroad President)—State your reason for thinking you should be allowed to make a living.
—From *New York Tribune*.

this friendly and co-operative spirit, and has taken occasion to publicly endorse it.

It is only since the actual solvency of their properties have been threatened, that the railways have combined in an effort to increase their revenues sufficiently to permit them to conduct their plants in such a manner as to meet the demands of commerce. Surely there is nothing to object to in such an attitude, nor should the Commission find fault with the efforts being made to rehabilitate the industry.

The attitude and the arguments of such men as Louis Brandeis and Clifford Thorne we can pass over without comment. Their bias is evident, and they have been largely discredited in public opinion. When an Interstate Commerce Commissioner, however, obviously attempts to embarrass a railway executive while making a plea for an increase in freight rates by inquiring if he thought that the railroads should be dealt with in any other manner than other industries affected by war conditions, it is little to be wondered at that the Commission itself is freely accused of a feeling generally antagonistic to the carriers.

It must be fully appreciated by the Commission that the present plight of the railways is only secondarily due to the effect of the war and that other industries, unlike the railways are free to apply such remedies as they may consider necessary to overcome the generally unfavorable conditions. In other words, they can increase prices, reduce operating expenses, and in a hundred other ways, handle their properties in a manner which is not possible for the railways to do under governmental regulation.

On the other hand, the railroads are forced to apply to the Commission for relief. The Commission regulates their rates, in fact has been steadily reducing them for a long series of years while at the same time compelling them to increase their operating expenses until a situation has been reached, irrespective of war, which has caused railway investment to be looked at askance by investors, not only in the United States, but in all other foreign countries. This is the situation the railways desire remedied and the war, so far as the carriers are concerned, can only be called an incident in connection with their generally unfavorable conditions. For an Interstate Commerce Commissioner, therefore, who thoroughly understands the situation, to ask such a question as referred to in our opening paragraph, shows a bias which is assuredly disheartening, when the real responsibility of the Commission for the welfare of our transportation interests, is taken into consideration.

The press of the country has been quick to catch this point of view, and many editorials have been published criticising the Commission for assuming such an attitude. To quote from an editorial which recently appeared in the New York *Tribune*:

> Questions asked at the railroad rate rehearing in Washington indicate that some of the members of the Intertsate Commerce Commission do not grasp the problem with which they are dealing. Their point of view seems still to be that of the railroad baiter in the good old times when railroad baiting was supposed to be a patriotic pasttime.
>
> Why was the case of the Eastern railroads, which had unsuccessfully appealed for a five per cent increase in freight rates, ordered to be reopened? Manifestly it was because the war in Europe had made the Commission's decision of August 1 look preposterous.
>
> A decision like that, which talked peace when there was no peace, could not be expected to give satisfaction. Public opinion was almost unanimous in regarding it as one of the most inopportune official judgments ever delivered.
>
> Yet although the Commission's belated discovery that a great European war had broken out was the only intelligible ground for granting a reargument we find the Commissioners asking questions indicating that the extraordinary depression caused by the war is in their opinion no ground for granting the railroads further relief. According to one account of the hearing on Monday, Commissioner Clements asked Mr. Willard, the president of the Baltimore and Ohio Railroad, "if he thought that the railroads should be dealt with in any other manner than other industries affected by war conditions."

> Such a question is little short of amazing. Other industries are left free by the Government to regulate their own affairs. They may raise their prices as they please without interference from Washington. But the railroads have no free hand. Their earning power is limited for them by the Interstate Commerce Commission's decrees, and they may be made to starve, even in the midst of general plenty, if the Commission thinks it advisable to starve them.
>
> The Interstate Commerce Commission needs to enlarge its vision and deal in the broadest national spirit with the rate question. Starving the railroads is a dead policy.

The Jacksonville, Fla., *Times-Union* takes a similar point of view and asserts that:

> From the grilling administered to the railroad men who appeared at the hearing, it looks as if the Interstate Commerce Commission, as at present constituted, is composed of men more prejudiced than the average of the American people against the railroads. Each witness was rigidly cross-examined, and the railroad men were reminded that the people of the United States as well as the railroads needed relief.
>
> This important fact was lost sight of: The people of the United States fix their own prices for what they offer for sale or for their services. There is no commission that holds to the lowest level short of confiscation the value of their products or of their services. If the railroads enjoyed this privilege that is accorded to all other classes they would not be now complaining.

The Philadelphia *Ledger* calls attention to the enormous power which rests in the hands of the Commission and the necessity for such a body to consider the great questions which come before it in the most broadminded manner. To quote from a recent editorial appearing in this newspaper:

> One-eighth of all the wealth of the United States is in railroads. Congress has seen fit to place this one-eighth of our national possessions in the hands of seven men. No other similar body is endowed with such power over the destinies of twenty billions of capital, two million employes and more than that number of investors.
>
> The attitude of the Interstate Commerce Commission which most amazes the public is its apparent hostility to the railroads. It was created to weigh facts and hear testimony, but not to perform the duties of a prosecuting attorney.
>
> What the public, which must pay the bills of both railroads and shippers, would wish is the Commission sitting as a judicial tribunal to hear cases. It ought to be equally friendly to both sides and antagonistic to neither.
>
> In resenting what bankers and others interested in this vast railroad property are doing to protect it, the Commission displays an attitude wholly unjustified. It is still the privilege of every American to guard what he owns.

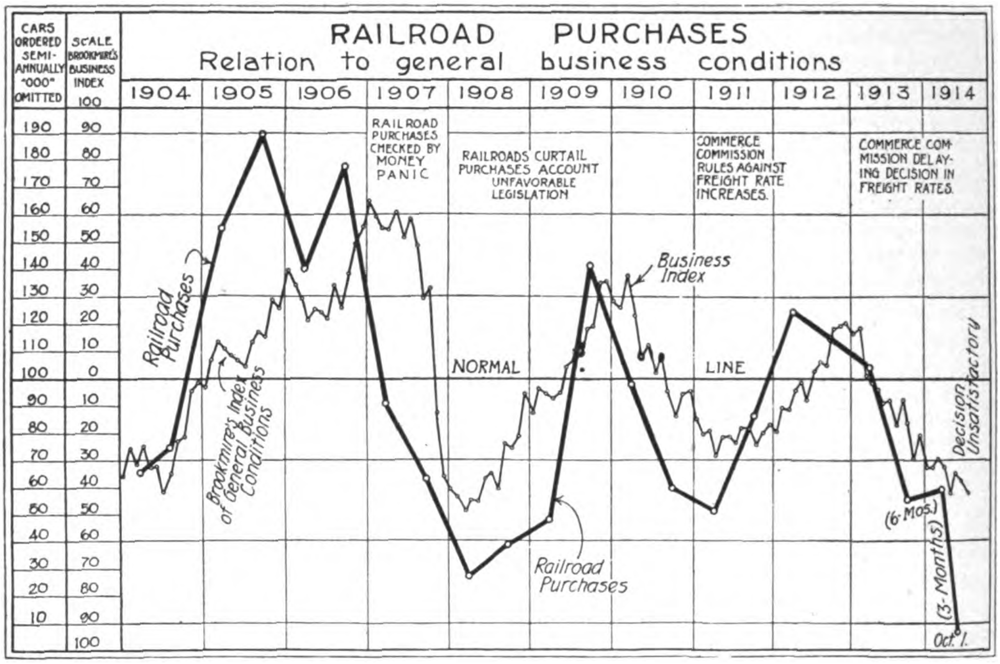
Arguing along similar lines, the St. Louis *Globe-Democrat* has the following editorially to say:

> The principal argument used against the granting of the application of the Eastern railways for an increase of rates was an attempted parallel between the railway and ordinary private business. The comparison of railway with ordinary business is not altogether fair. Furthermore, the Government has done everything in its power to aid ordinary business. It has extended the Aldrich-Vreeland currency act and enlarged it to care for the emergency in credit conditions. But ordinary business is not run by the Government as the railways are. They must in all practical matters submit to the judgment of the Interstate Commerce Commission and the various State commissions and to the acts of Congress and the various legislatures. They must submit every schedule to the scrutiny of commissions, who hold hearings on complaints of shippers. Since the Government has seen fit to exercise these large powers, which experience showed to be necessary, it has morally bound itself to do justice to the railways as well as to the public.

THE RELATION BETWEEN RAILROAD PURCHASES AND GENERAL BUSINESS CONDITIONS

Mr. E. P. Leigh, president of the Chicago Railway Equipment Company, has recently had prepared the following interesting diagram showing the relation of railroad purchases and general business conditions. Using the number of freight cars built each year as a unit for railway purchases, the results year after year have been projected on the well known chart of the Brookmire Economic Service for a ten-year period. The chart clearly shows the relation which exists between railway purchases and the trend of general business and as Mr. Leigh points out, confirms the soundness of the doctrine that railway purchases measure general prosperity. To quote from his article:

> It should be noted that up to 1898 these two factors ("railway purchases" and "general business") moved in normal relation; but in 1908 a new condition or factor, appeared, due to the investment of the rate making power in the hands of the Interstate Commerce Commission. Thus, for the first time were railway purchases controlled by abnormal rather than normal conditions, and have so continued, more or less, from 1908 to the present time. The year 1908 was notably the leanest of business years notwithstanding bumper crops, plentiful money and absence of disturbed political conditions, the three recognized elements making for good business. It likewise recorded the smallest number of cars ordered during the period, and the minimum of railway purchases for many years past. In 1912, heavy purchases continued throughout the year, carrying general business to the high peak, at the end of the year.
>
> While general financial conditions are essentially fundamental to all industry and commerce of every character, the railways, consuming di-



rectly or indirectly, between forty and fifty per cent of the production of the steel and iron industry, it is a basic industry clearly indicating the basic factors in initiating a general business method and whose causations of purchases (conversely) retard such a movement. In other words, regardless of favorable money conditions, crop conditions, political conditions, or any of the other fundamental contributing factors to a sound business condition, unless the railways are placed in a position to make purchases, and do not make purchases on a normal scale, normal prosperity is held from general business. It is this great salient feature of the question which the Interstate Commerce Commission is urged to recognize, as it has been recognized by the industrial and commercial world.

Sooner or later, in one way or another, the sound policy of "live and let live" must be invoked and applied to this question, if our railways, our industries, and our commercial enterprises are to enjoy a measure of prosperity. It is directly or indirectly a matter of vital importance to every individual of our Nation.

POLITICAL INFLUENCES AFFECTING RAILWAY OPERATIONS

Attention has been called in past issues of the RAILWAY WORLD to the pernicious effect of unfair political interference with railway operations. The railways have suffered to an unusual extent in this particular, and it is not going too far to state that had not hundreds of wholly unnecessary and ill-advised laws been placed upon the statute books during the past few years, the financial condition of the carriers would not be giving railway officials and investors the grave concern which it does at the present time.

A large number of these laws were purely the result of political expediency and were recognized by many, at the time of their passage, to be directly opposed to by the best interests of the transportation industry. The two-cent passenger laws and the full crew laws, are striking examples of this class of legislation.

The full crew laws are peculiarly offensive in that in no instance have they been justified by actual conditions. Their passage has been caused by the direct influence of the labor vote and has resulted in forcing the railroads in various States to employ a large number of men for whom there was practically no work. This has proved a great detriment to the service and rebounded to the disadvantage of those who had legitimate employment.

More recently there has been a revulsion of feeling with reference to these laws and railway officials are vigorously demanding their repeal in a number of States.

In this particular the election results in Missouri were highly encouraging. In that State the full crew law was voted upon under the recently enacted referendum, with the result that there was 324,085 votes cast against the full crew laws as against 159,593 in its favor. In other words, the measure was defeated by 164,492 votes. To quote from an editorial appearing in the New York *Times* shortly after the election:

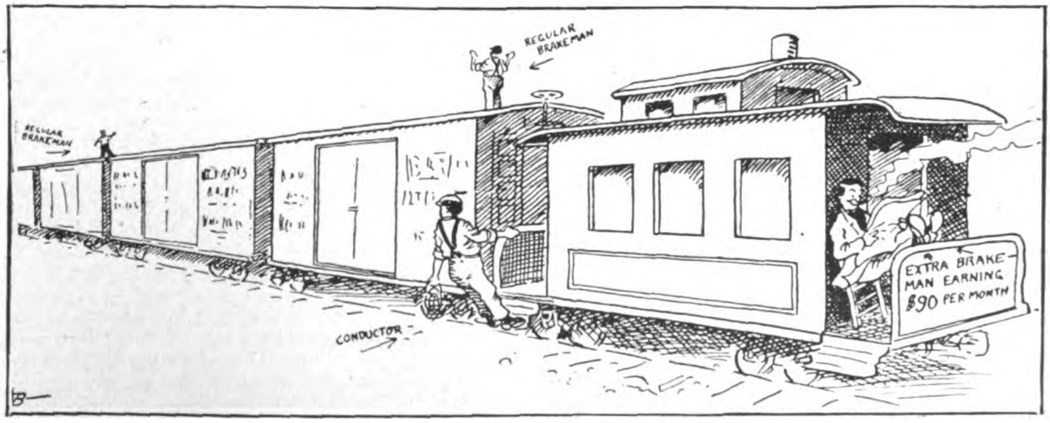
> The Missouri referendum upon the full crew law is the second best thing which could have happened. The first best thing would have been for the voters to have elected the sort of Legislature which neither could nor would pass a law necessitating its veto at the polls. The one thing about the referendum above criticism is that it cannot be misunderstood or misrepresented. The issue presented was so naked and so clear that the vote of three to one in the negative speaks for itself.
>
> The full crew laws have been passed mainly by the activity of the Brotherhood of Railroad Trainmen. The opposition of its membership was so pronounced that it was necessary to pass a resolution forbidding members to sign petitions against labor legislation, and also forbidding them to "interfere with the work of their legislative representatives without violating the law of the brotherhood, which would mean expulsion for the offending party."
>
> That is the way to secure legislation unfit to be passed. It is not the way to get the confidence of the voters, or to give labor legislation a high place in the esteem of non-unionists, who are nine tenths of the people. It is only in such ways that it was possible to enact this law in Massachusetts, for example. It was pressed through ten years of effort, and finally passed over the adverse report of the Railway Commission, and vetoed by Governor Foss. There have been eight full crew laws before Congress, but as yet none has run the gauntlet. The repeal of the full crew laws in the score of States which have passed them would be almost as good as an advance of rates confined to those States. The repeal of all the anti-railway laws in all the States would be better than the advance of rates upon which so much is thought to depend. Yet not one word has come from the Interstate Commerce Commission on the subject. The Commission has an eye solely for the reduction of rates, and thinks not at all of reducing costs. Yet the reduction of costs and the reduction of rates must proceed together. The Supreme Court, for all its dignity, reversed itself in time. Can it be possible that the Commission is less accessible to popular opinion than the Supreme Court?

There are many indications that railway employes are also beginning to appreciate the detrimental influence of these full crew laws upon their own welfare, and are joining the operating officials, in an effort to abolish them. Recent developments show that the influence of the labor vote is, at present, felt heavily in the legislative halls of the country but labor has yet to learn that, though its influence may at times force the enactment of legislation of an unfair and selfish character, the higher economic laws will eventually adjust the balance. Such methods, in the long run, must result in the loss of both prestige and prosperity to those who support them.

THE AMERICAN RAILWAY PROBLEM AS VIEWED BY EUROPEAN EXPERTS

In spite of the war and the pressure of more vital affairs at home, Europe continues to make a close study of American railway conditions and it is apparent that many foreign railway experts consider that the railways of the United States have reached a crisis in their existence under private ownership. Last month we took occasion to quote from the *Zeitung des Vereins Deutscher Eisenbahnverwaltungen,* the official journal of the German Railway Association, regarding the attitude of the Interstate Commerce Commission towards our railways. This same publication has recently published a series of editorials on the American railway situation, from one of which, entitled, "The Present Decline of Railways in the United States," is taken the following quotations:

> That United States railroads are in evil days has been repeatedly pointed out in these pages. Their expenses are on a constant climb, due especially to ever-increasing demands of labor and



EVERYBODY WORKS BUT EXTRA. —From the *Age Gazette.*

advancing cost of materials; yet the companies are allowed only with great restrictions or not at all to protect themselves through higher rates.

From many quarters it is demanded that rate increases, the need for which is admitted, shall not apply to freight. That most of the roads must exist on freight and make little or no profit from their passengers is an open fact. In the United States the operating ratio in passenger traffic has risen decidedly.

For passenger service ever better equipment is provided, still the fares have declined. Average receipts per passenger mile, 2.35 cents in 1888, fell to 1.93 in 1909, since when there has been a slight upturn. During this whole period many improvements have been made. The latest is the steel car, which the public demands, but which costs 40 per cent more than the old style car, and besides, because of its weight, considerably raises operating costs. Electric light, the more expensive toilet and wash facilities, heating and ventilation, all contribute their share to the advance in expenses.

In freight traffic, on the other hand, aside from the growth of fast freight, many economies have been effected—especially noticeable on heavy freight lines. On the Pittsburgh and Lake Erie the trainload rose from 465 tons in 1893 to 1,225 in 1913. The earlier 20-ton car has given way to the 60-ton, a capacity increase of 200 per cent; yet maintenance of the new cars costs only 20 per cent more.

Cost of locomotive maintenance has doubled in twenty years, while wages have increased by half. The increasing weight of locomotives and cars has made necessary stronger bridges, and roadbed, so that capital invested, and consequently interest charges, have expanded. The larger American roads have strikingly low freight rates, but even on the others the average is small.

The number of employes from 1907 to 1913 increased 10.6 per cent, and the wages paid increased 30 per cent; and since this constitutes 63 per cent of operating expenses and 44 per cent of earnings, it is no wonder that the operating ratio, which at the opening of the century stood at 68 per cent, has climbed to 73.5 per cent.

The arbitration boards, appointed to settle disputes between the roads and their employes, especially the trainmen, have encouraged this latter increased expense and it seems a fact that the roads have reached the limit of their ability, if they may not increase their revenue through higher tariffs.

The feeling abroad, so far as it can be gleaned from published statements, is overwhelmingly against the attiude of our regulative authorities, which is found to be unfair and unduly restrictive. We have yet to see a single favorable comment from foreign sources as to the present attitude of our regulative authorities. To most foreign writers, it appears incomprehensible that an enlightened people would permit such authorities to virtually strangle an industry through whose veins flows the life blood of one of the world's most progressive nations.

Perhaps some of these foreign authorities do not appreciate how hard it is, at times, for the people to procure proper representation from those upon whose shoulders they have placed the responsibility of government. The atmosphere at Washington appears to have a peculiar effect upon some public officials and to develop their bump of egotism to such an extent as to cause the loss of their sense of proportion, both as to their own importance and the real requirement of their position.

The whole country is thoroughly familiar with the fact that business men are now practically a unit in their desire to have railway rates increased. It is well within the truth to state that there are hundreds of thousands of business men to-day in all sections of the country, who are hoping daily for a favorable decision from Washington. As a matter of fact there is practically no antagonism worthy of the name to the proposed increase. Yet despite this known sentiment on the part of those who foot the freight bills, the Interstate Commerce Commission delays its decision in a most deplorable manner. The entire nation is back of the railways' appeal, and yet the Commission resorts to inexcusable and deplorable delays, while it hides under the protection of the lofty dignity of its office.

Another recent foreign criticism of American railway affairs comes from the London *Statist*. After discussing the disastrous effects of the country's regulative policies upon various railways, which, it affirms, have been carried to an extent far beyond the interests and demands of the people, the *Statist* asserts editorially that:

> The railways of the United States have had legal restrictions imposed of double-barrelled character. In the one direction there has been a cutting down of rates that companies are permitted to receive for services rendered to the public, and, on the other hand, the necessity to carry out measures for working the railroads, measures that entail extra costs.
>
> Beyond governmental and state regulations for safety of working, &c., the railways have been subjected to constant demands for increased remuneration, modification of hours of work, &c., for employes, and also additions to taxes, &c. It would be tedious to seek to detail the et ceteras.
>
> The application of a remedy is imperative, and the remedy is a readjustment of rates. In a word, it is necessary for the United States to permit the railroad companies to raise rates to an equitable extent. Changed circumstances in the United Kingdom recently necessitated the taking of this step here.

FURTHER EXAMPLES OF THE WASTE OF GOVERNMENT OWNERSHIP

The Bureau of Railway News and Statistics at Chicago has recently prepared a statement, based on official figures, which shows that had the two government railways of France in 1913 equalled her private railways in economy of operation, there would have been a saving to her taxpayers of approximately $17,000,000. It might be added, that where similar comparisons have been available, the experience of government ownership always produces strikingly similar results. Government methods have been, and always will be wasteful, when compared with the more carefully developed methods of private enterprise. The very nature of the effort compels such a result. In government ownership, both individual initiative and competition are destroyed, and nothing yet has been devised which can overcome the effect of the elimination of these influences upon the economic management of business affairs.

To revert to the situation in France, of the 25,265 miles of railway in that country last year 5,611, slightly more than one fifth, was operated by the two government lines, the "Old State" and the Western. How these two lines under the care-free disbursal of public moneys, compared in efficiency with the large private companies is demonstrated by the spending of $83.50 out of every $100 receipts to run the Old State, and of $86 out of every $100 revenue to run the Western. In sharp contrast the Northern operated only $61.30 out of every $100 receipts, the Eastern on $61.60, the Orleans on $59, the Paris-Lyons-Mediterranean on $57, and the Southern on $55.50, an average for all the private companies of $59.50 against an average for the two State lines of $85.

Receipts and expenses of the two State lines compare as follows with the total of private railroads:

	Receipts.	Expenses.	Ratio.
Old State	$15,000,000	$12,500,000	83.5%
Western	50,500,000	43,300,000	86.0%
Private Rys.	346,000,000	206,000,000	59.5%

A ratio such as that attained by the private companies, if applied to the Old State, would have meant a saving of $3,600,000, and if applied to the Western, a saving of $13,382,500; a reduction of operating expenses in each case of practically 30 per cent, and a total saving of some $17,000,000.

On the other hand, had the private companies operated as wastefully as the government lines, the loss would represent over $88,000,000, and operating expenses would have been $294,000,000 instead of $206,000,000.

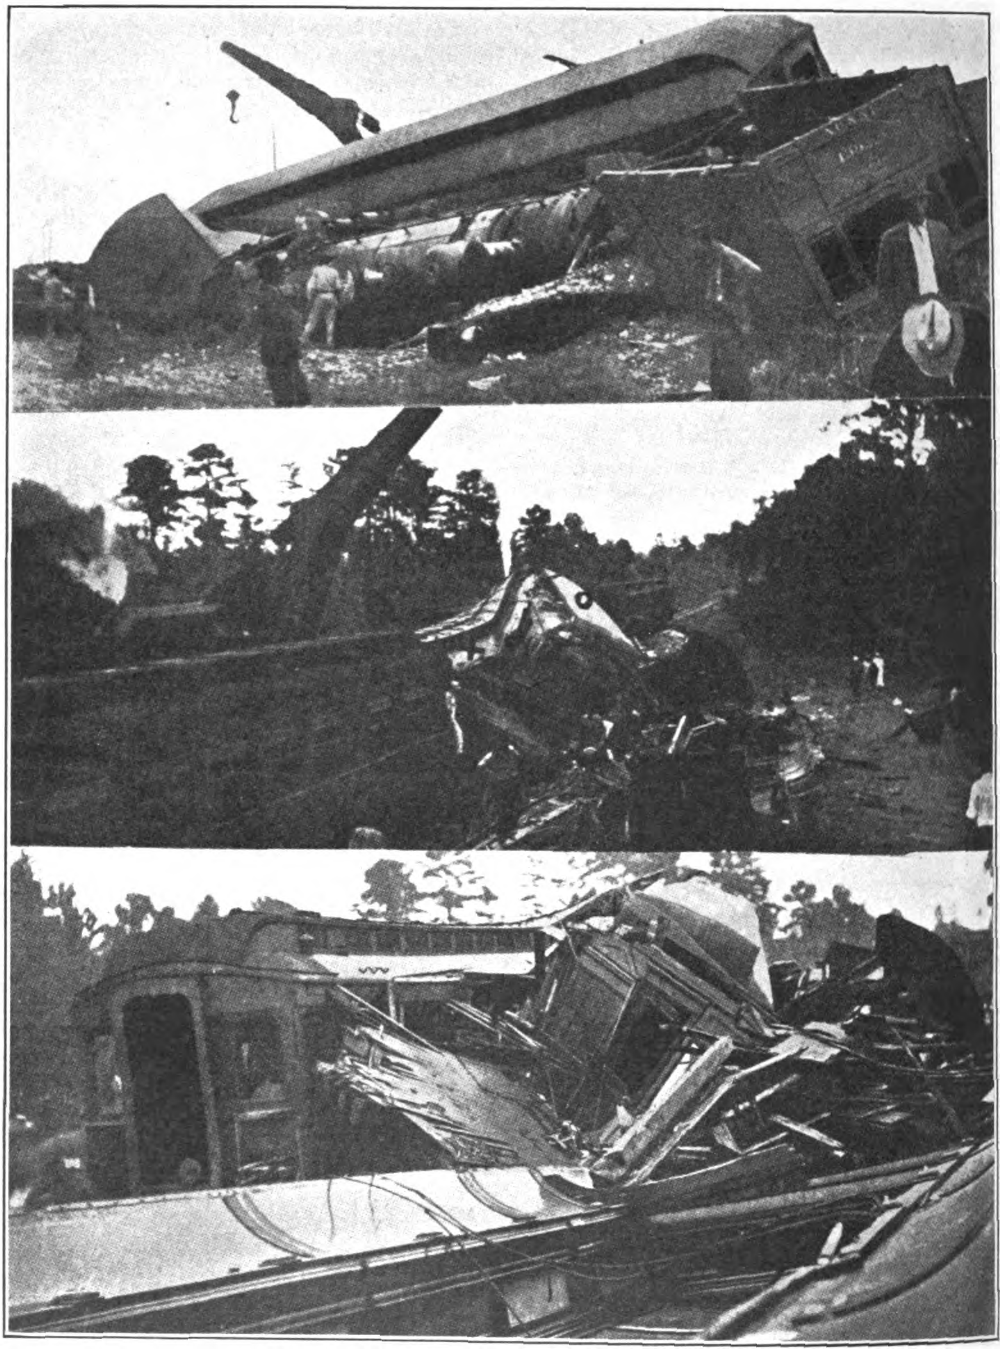
Even this enormous total of $85 in expenses to every $100 revenue on the two State lines in 1913, moreover, represented an improvement, for in 1912 the figure was $89. Aided by a bumper apple harvest in Bretagne and Normandy, in which the State roads were the chief beneficiaries, Colson says that "after the profligacy of expenditures in preceding years the State made a serious effort to arrest their growth, effecting notably elimination of trains on lines of light traffic, compensating for these on which traffic expanded. The operating ratio of the two lines thus fell from 89 per cent to 85 per cent, a figure still excessive enough for roads enjoying $11,383 in receipts per mile, especially when one adds the large additions to capital for maintenance."

Against a net of $9,700,000 left after payment of expenses, the State had to meet fixed charges amounting to some $26,000,000, resulting in a deficit of $16,000,000 to the treasury for the year.

In spite of the notably poor showing of the government lines compared with the private, they enjoyed higher rates on the greater part of their traffic. As on most of the State systems passenger rates, representing a direct charge on the public were lower, averaging on the Old State 0.92 cents per mile and on the Western 1.00 cent per mile, against 1.08 cents for all railways. Freight rates, on the other hand, not so directly paid by the public averaged 1.60 cents per ton mile on the Old State, and 1.62 cents per ton mile on the Western, against 1.31 cents for all railways. Even this lower average is almost double the average received by United States railways, 0.73 cent per ton mile in 1913.

THE SAFETY OF THE STEEL CAR

Railway accidents which have occurred during the past year have convincingly demonstrated the safety of the steel car as compared with cars of wooden construction. This comparison has seldom been more strikingly illustrated than in an accident which occurred on September 18th on the Alabama Great Southern Railroad near Livingston, Ala. The accident was caused by an unknown criminally inclined person who opened a spur switch



Upper View Shows Derailed Locomotive and Roof of Combination Baggage and Express Car. Middle View Shows Wreckage of the two Coaches and the Combination Baggage and Express Car, While Lower Photograph is General View of Wreckage, Looking North.

just before a passenger train en route from New Orleans to Cincinnati, reached it. This train consisted of one steel underframe mail car, one steel underframe express and baggage car, one wooden coach, one steel underframe coach, one all-steel Pullman sleeping car, one wooden Pullman sleeping car, one all-steel Pullman sleeping car and three wooden Pullman sleeping cars, in the order given. At the time of the accident, this train was running at about fifty miles per hour, and, on account of the tampering with the switch, the engine collided with a car of slag and railroad ties at the end of the spur, the car of slag being driven beyond the mound. The accident resulted in the death of eight passengers, one employe and one mail clerk and the injury of twenty-eight passengers, three employes, five mail clerks and four Pullman porters. The accompanying illustrations give an idea of the general appearance of the cars shortly after the wreck occurred.

The Interstate Commerce Commission, through its safety division, has issued a report on this derailment and entirely exonerates the railroad from any blame, placing it upon the shoulders of the unknown person who criminally opened the spur switch at a time when the train was too close to permit the engineer to stop, although all possible efforts were made, including the application of the brakes, the reversal of the engine and the opening of the sanders.

From a technical point of view, the chief interest in the accident lies in the fact that all classes of passenger equipment were represented, that is, the steel car, the steel underframe car and the wooden car. The greatest damage was sustained by the first four cars of the train which, as before mentioned, consisted of one steel underframe mail car, one steel underframe express and baggage car, one wooden coach and one steel underframe coach. The third car, a wooden coach, was practically destroyed, while the second and fourth cars, constructed with steel underframes, were very badly damaged, the first car also with a steel underframe, was not damaged as much as the others, probably on account of having been thrown on one side. In the wooden coach there were either six or seven passengers, three of whom were killed and the others injured. In the steel underframe coach, there were fifteen passengers, five of whom were killed, while all but one of the others were injured.

H. N. Belknap, chief of the Division of Safety of the Interstate Commerce Commission, in commenting on the relative safety of these cars as indicated by the accident, made, in his report, the following statement:

> While none of the steel underframe cars was entirely destroyed, as was the wooden coach, nevertheless it appears questionable, when comparing the damage sustained by the different types of cars in this train, whether the steel underframe type of car afforded a materially greater degree of safety to passengers than the wooden coach. Steel underframes will probably prevent the buckling or breaking in two of a car, and in that respect cars so constructed are undoubtedly an improvement as compared with cars built entirely of wood; if practically every thing above the steel underframe is to be destroyed in an accident, however, it is apparent that but little increased protection to passengers is afforded. The fifth car in the train, an all-steel Pullman sleeping car, was practically uninjured, all the damage sustained by it being confined to the trucks and running gear. In this accident the performance of cars of different types very strongly supports the view that the greatest degree of protection to passengers can be afforded only by all-steel cars.

PRACTICAL RESULTS OF THE SAFETY FIRST MOVEMENT

Attention has been called before in these columns to the dollars and cents application of the safety first movement as well as its direct bearing upon the conservation of human life. Not only are there saved to the railways, annually, many hundreds of railway employes, but the great reduction in personal damage claims as well as the greater protection offered to equipment, makes the safety movement well worth while from a purely financial point of view. This is strikingly brought out in a statement recently issued by the Southern Pacific Company. That the safety first activities of this company are not confined to passenger traffic alone or to the safeguarding of employes, is shown in the fact that a record has been established for the prevention of loss and damage to freight, in spite of the fact that approximately thirty per cent of its freight traffic is perishable and thirty-four per cent merchandise and products of manufacture.

The above is brought out in comparative figures showing the ratio of loss and damage claims to freight revenue for the important trunk lines of the country. These figures show that there is but one road with a lower percentage than the Southern Pacific, and that is an Eastern road whose principal freight traffic is in coal.

A glimpse at the figures showing the standing of the roads in this connection shows that most of the railroads are constantly striving to reduce the percentage. The old days when the consignees approached their shipments with trepidation, expecting to find their goods battered around, are past and gone. To-day the railroads are doing their utmost to place shipments in the hands of the consignee just as they are turned over to them by the consignor. To be successful in this, they have to enlist the active co-operation of stationmen, trainmen and all division officers.

The Southern Pacific's low percentage is

89-100 of one per cent. This it has maintained for two years. Vice-President and General Manager W. R. Scott, of the Southern Pacific, has issued a circular letter congratulating the train and stationmen on their careful work and interest, and the division officials on their active supervision.

THE PUBLIC'S INTEREST IN THE SAFETY MOVEMENT

Much has been written within the past year or two with reference to the marvelous results which have been obtained by public service corporations and large manufacturing plants in the adoption of a greater safety propaganda by which, through the installation of safety devices and the education of the employe along safety lines, a great decrease both in injury and death has been accomplished.

As railway officials fully appreciate, the conservation of human life through the safety movement has proved so effective and so remarkable as to cause it to be adopted by practically every railroad system of any importance in the United States. In addition, the habits of carefulness, which the movement tends to develop in the average employe, have led to a more considerate and careful handling of the companies' property and have thereby saved large sums of money annually by a greater protection of all classes of equipment. From a financial point of view, the movement has proved eminently successful, paying enormous dividends on all moneys expended in its promotion.

A phase of the greater safety movement which has not, however, received much attention, relates to its adoption by the general public. It was not until railway safety statistics began to be generally compiled and classified that the fact became known that a great proportion of so-called railway accidents were due to no fault of railway management or operation. For example, it has been found that a large proportion of accidents to railway employes is entirely the result of the carelessness of the individual; and while this is being corrected as rapidly as possible by educating the employe along safety lines, there still remains the general public, many thousands of whom are either annually injured or killed by so-called railway accidents, but for which, as with the railway employe, the individual is entirely responsible. Thus thousands of trespassers are maimed or killed annually while hundreds, if not thousands, of passengers are similarly injured by their careless disregard of general safety conditions in their methods of getting on and off trains, conducting themselves in railway stations or improperly employing railway crossings.

This general question of educating the public along greater safety lines was recently interestingly discussed by Mr. Martin J. Insull before the Annual Congress of the National Council for Industrial Safety, held in Chicago on October 13th. Mr. Insull believes that while the public may at first object to an effort on the part of public service corporations to educate them along the lines of greater safety, such a movement must eventually cause the establishment of closer and more friendly relations. He points to the fact that other service corporations, aside from the railroads, annually report the injury or death of hundreds of individuals for which such corporations were in no wise responsible. Referring to the electric lighting industry, of which there is scarcely a more hazardous business, he asserted that less than ten per cent of the accidents resultant therefrom, were really chargeable to the hazards of the business and most of them could have been avoided by ordinary care and thought. In closing his address Mr. Insull said:

> I feel I have good reason to make the pleas for accident prevention along general lines because until this is accomplished how can the public service corporations, or the industries, expect accident prevention along special lines? While we, in our particular lines of industry, are endeavoring to educate the public in the prevention of accidents incident to that industry, we must assist in every way we can in their education along the more general lines of accident prevention. The public service corporations can, through their necessary closer contact with the public, do a great deal in this campaign of education. It will undoubtedly take the public some time to appreciate that the work is being carried on for their benefit. When they do, however, we shall, I am sure, find them ready and willing to assist in any way they can and working together the public and the public service corporations in a safety movement for the common good, must result in a closer and, if possible, a more friendly relationship than even exists to-day.

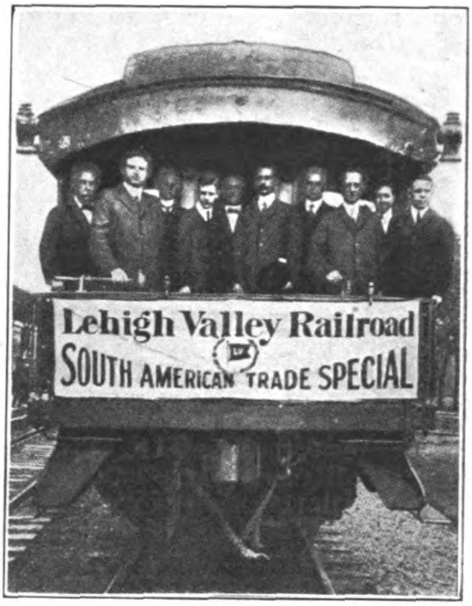
"MADE IN AMERICA" CAMPAIGN

Strenuous efforts are being made these days to push American trade into those quarters which have, until recently, been largely cared for through European effort. At the same time steps are being taken to stimulate a greater demand in our own country for American-made goods which, in the past, have been supplied, to some extent at least, through foreign sources. For example, a Louisiana company is preparing to revive two industries at once by selling Louisiana sugar, packed in cotton bags, direct to the consumer. As another example, Paterson, N. J., has recently been calling attention to the fact that it is the world's greatest silk manufacturing city. In fact the American business man is, as usual, rising to the occasion and making a mighty effort to offset the restrictive influences of the European war, both in the home markets and in the markets abroad.

Perhaps the interest in the South American trade has been the most general of all, as the possibilities of its enlargement have become more fully realized. These countries, which have been big buyers of European merchandise, have now found this source of supply practically cut off, and while there are still many difficulties in the way of this trade being fully absorbed by the United States, the opportunity is unquestionably there, and no one who fully appreciates the energy and enterprise of the American business man, doubts that the ways and means will not eventually be found.

The accompanying illustration is offered as an example of how the railways are making an effort to stimulate the general interest of trade possibilities with our great southern neighbors. The Lehigh Valley's effort by no means stands alone in this particular, as railways in all sections of the country are paying more or less attention to the development of this trade. It is of interest to note, however, that in connection with the Lehigh Valley's effort, twelve large manufacturing concerns on this railroad's lines have thus been led to make a start in pushing their goods in South America.

This is only a slight indication of the tremendously important part played by railways in industrial and commercial developments, but it is enough to indicate the danger of restrictive public policies upon activities of this kind. The railways are great up-builders of national prosperity, and to restrict their efforts or unfairly burden them, is to place a similar load upon the back of every industry of the country. Sooner or later the public will come to more fully realize this fact, and when it does the politician and the public regulator will find that railway baiting and the restriction of railway enterprise, is no longer a healthful pursuit.



EFFORT OF LEHIGH VALLEY TO INCREASE INTEREST IN SOUTH AMERICAN TRADE, WHICH HAS PROVED HIGHLY SUCCESSFUL.

Commercial interests as well as the railways are giving increased attention to the possibilities of the South American trade and as an indication of the progress being made, it is of interest to note the following meetings which have taken place recently for this specific purpose:

The Trade Conference at Atlanta, Georgia, called for the purpose of discussing the possibilities of developing the field for South American manufacturers; the luncheon of the Merchants' Association in New York at which over 1,100 business men were present, the subject under discussion being the trade opportunities in South America; a meeting of the Jacksonville (Fla.) Board of Trade for discussion of similar subjects; the meeting of the Business Men's League in St. Louis and luncheon, with South America as the general subject of discussion; the annual dinner of the American Exporters' Association in New York, at which two of the speeches were devoted to South American opportunities; the Machine Tool Builders' Convention, held in New York, at which part of the afternoon was given over to South America; the convention of the American Hardware Association in Atlantic City, with a half day devoted to South America; the convention of the New England Jewelers' Association at Providence, R. I., with the annual meeting partly devoted to South America, and a conference called by Governor David I. Walsh and the State Board of Labor and Industries of Massachusetts for the study of foreign trade development.

The Chicago Association of Commerce has been active during the month in formulating plans in extending the work and scope of the exhibit which it has maintained at Buenos Aires for a number of years. The manufacturers of Bridgeport, Conn., have also been studying the field critically.

Besides the formal meetings above mentioned there have come to our attention the news of the organization of numerous export committees of chambers of commerce, and the formation of export clubs and divisions. There is practically no association of commerce in any of the large cities in the United States, that has failed to take up a serious study of the possibilities of trade extension in South America.

THE QUESTION OF PUBLIC RELATIONS

The question of public relations between the Baltimore and Ohio Railroad and the communities served by its lines is one of absorbing interest to the management, as indicated by a circular which has been sent to all officials, agents and other representatives of the road, urging them to exert every effort to promote good will by bringing about a fair understanding of the railroad problems while at the same time according due consideration to public rights.

Representatives of the railroad have been instructed to keep in touch with matters of state and municipal government, as well as with the activities of business organizations, so that where railroad questions are involved the company may secure a hearing when propitious for it to do so. The sense of the circular is that the local representatives of the Baltimore and Ohio shall act in a representative capacity for the management.

At meetings of town councils, trade organizations or citizens the railroad representatives are urged to enter their appearance and give consideration to the questions which come up. In this way the management aims to put itself in intimate touch with public opinion in order to work along co-operative lines with the communities upon whom it depends for revenue.

Agents and others are urged to keep themselves informed through the medium of the local press and forward such articles as may be of interest to superiors. The purpose of the Baltimore and Ohio policy is to extend the plan adopted recently of tendering to the various communities the expert services of its engineering, transportation, traffic, industrial and other officials free of charge in working out their problems. Officials of the Baltimore and Ohio are called into consultation often on problems concerning water works improvements, street construction, erection of buildings, etc., the aim being to give the communities the benefit of every possible assistance.

The present policy of railroad management which has as its foundation co-operation between transportation interests and the people they serve suggested the circular which is being sent to Baltimore and Ohio representatives.

GEORGIA COMMISSION TO HELP RAILROADS

The Railroad Commission of the State of Georgia, realizing the serious financial predicament in which the railroads are at present, has decided to come to the rescue of the transportation interests to tide them over their dilemma. The chairman of the Commission in a letter to the general counsel of the Southern Railway states that owing to the material decrease in the revenues of carriers the Georgia Railroad Commission will not now nor until the present financial situation is relieved impose upon any of the roads subject to its jurisdiction any expenditures for new stations, warehouses, terminal facilities, etc., except such as are absolutely necessary. If the Railroad Commissions of other States follow the example of the Georgia Commission it will aid greatly in saving the roads from the financial ruin which is now staring them in the face. Matters look particularly blue for the various Southwestern lines which have been greatly hampered by expensive and unreasonable legislation and rulings of various kinds.

Contemporary Opinion

National Prosperity versus Railway Rates.

(From *The Kernel,* New York.)

WHAT is the answer of the Interstate Commerce Commission to the renewed appeal of the Eastern railroads for privilege of making a general increase in rates? This question is probably uppermost in the minds of the people from one end of the nation to the other. The war and its effects have in three months advanced the financial education of the people probably more than it would have progressed in a decade under normal conditions. The people now realize and recognize the need for and legitimate uses of stock exchanges and commodity exchanges as they never have before. In like degree the public appreciation of demagogues who seek by attacks on business to develop political capital among the ignorant has lessened. Has the business view of the Interstate Commerce Commission as a body been broadened by the predicament into which business has been thrown by the effects of the European war?

In a decision of the Eastern rate case on July 29, the Commission found "that the net operating income of the carriers in Official Classification territory, considered as a whole, is smaller than demanded in the public interest, but that no showing had been made warranting a general increase in trunk line rates, in rail-and-lake rates, or in rates on traffic moving between the different rate territories"; it granted five per cent increase in class and commodity rates within the territory of the Central Freight Association; it suggested to all carriers involved methods by which net income might be increased without a general rate increase. Explaining its failure to grant the increase in rates asked, though it found the railroad income to be inadequate, the Commission said that the law "casts upon the carriers the burden of proof, requiring them affirmatively to show the reasonableness of increased rates" and that "the law did not confer upon us the power of aiding general prosperity or of introducing new economic policies through railroad rates." These things are true, but it is also true that the Interstate Commerce Commission possesses absolutely arbitrary power to accept an unsound and foolish argument against rate increase and to reject a logical argument in favor of it. The Commission, if it is absolutely wrong in its decision, does not even have to apologize for its error. One of the first principles of law is that laws must be reasonably construed. Framers of the law did not specifically charge the Interstate Commerce Commission with promotion of general prosperity, but every citizen of the United States, man, woman or child, every public offical, executive, legislative or judiciary, is by all rules of common sense morally obligated to do that which lies within his power to aid and preserve the prosperity of this country. The Interstate Commerce Commission has found the income of the Eastern railroads to be smaller than the public interest demands. Being the only authority to which the railroads can appeal for higher compensation, why should it not grant such rates as the public interest demands?

As to "methods by which the railroads may increase their net income other than by a general rate increase" suggested in the decision of July 29, the railroads proceeded with all possible dispatch, doing all that brains and flesh and blood, pen and ink and printing presses could do, to take advantage of them. One large system added 30 new clerks and working nights and Sundays required over 30 days to revise and reprint its tariffs. It was found that owing to the Supreme Court decision in the "tap line" case many of the Interstate Commerce Commission's suggestions with reference to increasing revenues by charging for what it conceived to be free service wrongfully granted could not be carried out and other constituted authorities such as State laws so conflicted as to prevent railroads from getting the benefits suggested. At the very outside, it appears, considerably less than one fifth of the relief originally prayed for, and in some instances not more than one tenth of such relief, can be got by the trunk lines from following the suggestions of the Commission.

The Railroads Appeal to the People.

(From the Philadelphia *Bulletin.*)

IN the varied category of legislation submitted to the voters of the different States for approval, Tuesday, no result is more interesting or suggestive than that which attended the voting of the State of Missouri on the "full crew law." Only one city in the State favored the measure and the country districts were convincingly against it. Although the measure had been passed by the Legislature and signed by the Governor, the appeal of the railroads to the people resulted in a popular vote for fair play and the rejection of the law.

The measure was a real issue in the campaign and the battle was well fought on either side. It was the first time that the railroad situation and the protest of the railroad corporations against overtaxing, unjust rate-restraint, crippling legislation, which has forced them to curtail expenditure, cut down wage-rolls, reduce their patronage of allied industries, had been submitted to a popular vote. The appeal had been made to legislatures and notably in Texas there had been in the past year a let-up in the attack. But in Missouri the case was carried directly to the people, and the so-called "popular," "labor," measure proved unpopular.

This Missouri voting is a pointer. Railroad-baiting has been as popular in Missouri as elsewhere. It, very likely, would be found to be as unpopular elsewhere as in Missouri, to-day, were the question to be submitted to the people in this manner. Normally the American people want fair play. They are apt to be carried too far in their crusades, but always swing back to justice. The movement for the restraint and regulation of railroads was justified, but in the enthusiasm—if not actual passion—the attack went too far and became injustice. A necessary public service has been crippled, the public suffers, and is coming to a realization of its duty, even to a railroad.

A Significant Act.

(From the New York *Evening Post.*)

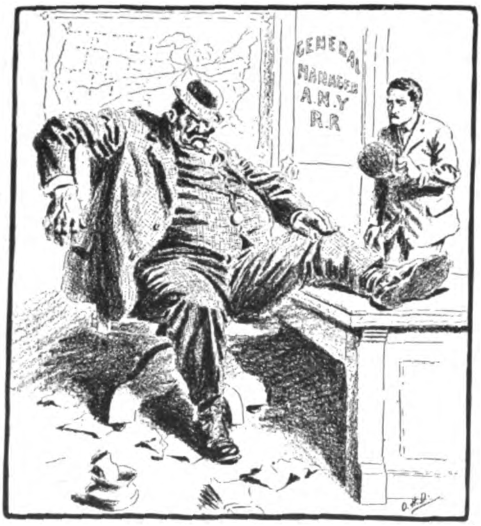
FOR the first time, a "full-crew" railway law was on Tuesday submitted to popular vote and was overwhelmingly defeated. This occurred in Missouri, where a bill had been passed by the Legislature and signed by the Governor, but was referred to the voters. They rejected it decisively. The result is significant in more ways than one. It is a pretty good index, in the first place, of the general feeling that the railroads have had about as many hard knocks as they can stand, and that it is for the good of the country that they should be given a chance to recuperate. Even more striking is the demonstration that the demand for full-crew laws—meaning the employment of more men than are needed to handle the trains—has rested solely upon a narrow labor union basis. Because the employes were organized and exigent, they have been able to terrorize legislatures and frighten governors and befool politicians. The pretense was that there was an immense popular backing for the movement. But at the first real test in Missouri, this was shown to be hollow. Railroad managers are warranted in hailing the event as most suggestive. It ought to help on the work for the repeal of full-crew laws in the States where they have been rashly enacted. All such legislative devices to "make work" are repugnant to sound ideas of efficiency and economy.

Government Ownership—The Master.

(From the *Railway Employes' Journal,* the official organ of the Brotherhood of all Railway Employes.)

THIS is a grim, ugly picture. It had to be that way—the subject is grim and ugly.

But it's a true picture. Look at it, study it, engrave it deep on your mind, for it shows exactly what is coming to you under government ownership of railroads.



The figure in the general manager's chair is your boss-to-be, the Rail-Master. The other figure is you, brother railroad man—you, service stripes on your sleeve, cap in hand; you, shabby, anxious, fearful, shaky in the knees; you, humbly and not very hopefully begging a chance to go on earning a living for yourself and your family.

The artist has made the Rail-Master bulky, paunchy, thick in the neck and little in the head—has given him bulging muscles, swollen veins and a brutal, ruthless, cruel face to match what is in his soul. As the picture shows him you will know him.

It is the brutal, arrogant spirit of politics made brutal, arrogant flesh that the picture reveals.

The public may see the Rail-Master a sleek, courteous individual, tastefully attired, ready-tongued and affable. But you, living your railroad life under government ownership, will see him as he sprawls in his chair in the picture. And the way he looks to you here is the way he will be to you then.

Look again. Do you see in the picture any railway brotherhood emblem in your buttonhole?

No—and when government ownership comes and the Rail-Master is in, you won't dare to have any brotherhood or union card in your pockets. There will not be any railroad brotherhoods or unions then.

When you go in to see the Rail-Master about your hours, your wages, your discipline, your job, you'll go alone. No salaried chairman with you to plead your case; no organization behind you to back up your petition or protest. Just you alone—you, shabby, anxious, humble, and the Rail-Master big in the neck and little in the head and heart.

A lot the Rail-Master will know about railroading—and a lot he will care! A lot he will know about your work, your needs or you—and a lot he will care!

Yes, a lot the Rail-Master will know or care about railroading, about you, or about anything except keeping his gigantic power and enormous profit.

With the government owning the railroads there will be no competition for the business. With himself owning the government—or being the government—there will be no competition and no control for him. He won't have to care about the public—he won't have to care about you.

Look at the picture again. One figure the Rail-Master, the other the Rail-Servant; one the Rail-Czar, the other the Rail-Serf. You the servant—you the serf!

You could oust the Rail-Master with your votes and put a just and competent railroad man in his place? Yes, you could—not. You might change the party in power, but the Rail-Master—the brutal spirit of politics made brutal flesh—would remain the same.

You could appeal to the President and have him right the railroad wrongs and your wrongs? Yes, you could—not.

Many lean weeks ago the heads of a number of great railroads—clean railroads—went to Washington and saw President Wilson. They showed him the desperate conditions of your industry and of you. They frankly asked his aid.

The President was convinced. He called on the country to relieve the railroads—publicly asked men of all conditions, in and out of public life, to see that justice was done to what he termed "the one common interest of our whole industrial life."

Fine!—but what kind of justice has been done?

None at all. The Interstate Commerce Commission reluctantly reopened the rate case. Hour by hour the plight of the railroad industry gets worse. The Commission does nothing—only quibbles and haggles.

The President said: "We must all stand to see justice done and all fair assistance rendered and rendered ungrudgingly."

But how is "the one common interest" treated before the very tribunal which the President appoints? Read how in any of the papers—like a burglar before a police court.

Clifford Thorne, the professional railroad-jammer, is there, windily and abusively baiting the railroads and denying their right to any relief. "Million-Dollar" Brandeis is there officially and for hire, harrying the railroads like a prosecutor. Members of the Commission ask the railroads questions that plainly show either gross lack of knowledge or deep anti-railroad prejudice—either ignorance or insult.

That's how much the President is able to do for your great industry against the spirit of politics not yet wholly in power over it. How much would he be able to do for you—single-handed, unorganized you—against the spirit of politics in absolute power, made flesh by and under government ownership?

Why, neither you nor anybody you sent could get by the secret service men, the flunkeys, the understrappers at the outer door of the President's office. The Rail-Master's creatures would turn you back.

And if you could see the President, what then? A President can't do much, it seems, for all the railroads with the commissioners who get their jobs from Presidents. What could he do for you—single-handed, unorganized you—with the Rail-Master from whom, under government ownership, presidents will get their jobs?

Under government ownership railroad men will have easy hours, steady jobs and good pay? Yes, they will—not.

Ask the army of half-shabby, wholly-sad governmental clerks over in Washington about the hours and the pay. Ask them what the government does for them when they get too old or too sick to work.

Ask the postman that brings your letters how easy his hours are, how light the work and how good the pay. Ask him what happens when he or the postoffice clerk tries to organize for better working conditions. Being under government ownership, the postman may not dare to tell you all he knows.

Ask any railway mail clerk running on your road what kind of an easy-hour, good-pay job he holds. Ask him if his fellows have a union and what happens to its officers if they dare to offer petition or protest. He, too, is under government ownership, but maybe, if you convince him you are not a department spotter he will tell you the truth—confidentially.

Remember, too, that the power of the postal over-lords is only a fraction of the power the Rail-Master will have over you.

Under government ownership the Rail-Master will have good jobs to give—but not to you, brother railroad man. The measure of a man's rank and pay will be political service, not railroad service. The man who regularly delivers a hundred votes can be or name a section boss. Whoever controls a ward or a township can be or name trainmaster or yardmaster. County bosses can be or choose superintendents. The State boss will say who shall be general manager—Rail-Master, master of you.

All over your country would-be Rail-Masters are crowding your industry to the wall, baiting it, jamming it, driving it into either destruction or government ownership. They know that when the government owns the railroads they will own the government—will make the industry that is now the nation's mighty servant the nation's almighty master—and yours.

And when government ownership comes in, it will come to stay forever. There will be no escape. The Rail-Master will never let go.

Look at the picture again—the grim, ugly, true picture of Rail-Master and Rail-Servant, that shows what is coming to you under government ownership—look, and know that government ownership is coming unless you stop it!

What Ails the Country?

MR. PAUL D. WRIGHT, president of the Reed Manufacturing Company of Erie, Pa., was one of the speakers at a dinner recently given in Erie, Pa., to a number of Pennsylvania Railroad representatives. He said in part:

"Cussing is the easiest stuff in the world to write and orate. Manufacturers and business men generally have not escaped, but I submit that the railroads have had more than their share. If the general public is to be prosperous, it must support the constructive elements, and the railroads are one of the greatest, if not the greatest, which we have.

"Intercommunication and exchange of ideas are the biggest single influences in the progress and advance of any civilization. The railroads are, therefore, the biggest single influence in this direction, and they should be freed from unjustifiable and unwarranted attacks.

"Secretary Redfield, of the Department of Commerce, has recently asked Congress for an appropriation of four hundred thousand dollars to find out what is the matter with this country.

"The only thing that ails this country is paralysis—paralysis of the pay envelope. The cause of the paralysis is the continued irritation of business and business men by the Government. Better let him spend four hundred dollars and ask 1,000 employers of labor what is the matter with this country, and the answer will come back, 'The hostile attitude of the Government toward the men who maintain pay rolls.'

"When you attack men who maintain pay rolls, you attack the wage earner, beat his wife and kick his children.

"To kill the courage and ambition of a business builder is to destroy, to an extent, a pay roll, and the destruction of a pay roll is a blow at employers, employes, storekeepers, manufacturers, and, as a result, women and children go hungry.

"Business must be allowed to expand along natural lines. Supervision is necessary, but it must be supervision by sympathetic able economists, by practical humanitarians, and not by hysteric experimenters, professional reformers or party politicians. Physically there is nothing the matter with this country. We have every element for prosperity save trust and confidence. And these the Government must give us, or there will be many new faces in the bread line. To picture all the railroads and all business men as greedy, grasping grafters is unfair. Business men who succeed nowadays tell the truth, keep their agreements and believe in the square deal.

"To tear down in a night a business structure which has taken years of patience and ability to erect is easy. To create, build, transport, distribute—these things only come about through able and patient leadership—not through political palaver, and I ask you, Is it wise to suppress our men who possess commercial genius and who maintain pay rolls?"

Railroads Fail to Share in South's Prosperity.

(From the *Southern News Bulletin.*)

AN interesting fact brought out by the reports to the Interstate Commerce Commission is that the railroads of the South did not share in full measure in the prosperity of the section. While their gross operating revenues increased at the rate of $215 per mile, the increase in operating expenses and taxes was so great as not only to absorb the total increase in gross operating revenues but to make an actual reduction in operating income of $85 per mile, or 3.2 per cent.

Reports of the railroads of the United States to the Interstate Commerce Commission for the year ended June 30, 1914, throw an interesting light on the development of the South during the year as compared with other parts of the country.

One of the best measures of the progress of a community is afforded by the gross operating revenues of its railroads. Measured by this standard, it will be seen that the South is the only section of the country that did a larger business during the fiscal year than in the last preceding twelve months.

In the Eastern district, north of the Ohio and Potomac rivers and east of a line running from Chicago to St. Louis, thence down the Mississippi to the mouth of the Ohio, gross operating revenues for the year show a decrease of $960 per mile, or 4.1 per cent. In the Western district, embracing all of the country west of the Chicago-St. Louis line and west of the Mississippi River there was a decrease of $440 per mile, or 4.3 per cent. In the Southern district, embracing the territory south of the Ohio and Potomac rivers and east of the Mississippi River, there was an increase of $215 per mile, or 2 per cent.

Getting Results by Co-operation.

(From the Bulletin of the Southern Pacific Company.)

SO much is said about co-operation nowadays that by some the subject is approached with hesitation. But, nevertheless, the big vital fact that by close co-operation results are more quickly obtained cannot be overlooked, forgotten or minimized. To say that by working together we can do more work and better may be the utterance of an unforgivable platitude, but it is one, the truth of which cannot be ignored. Experience emphasizes this at some time or other in the ordinary course of every man's life.

In the organization of a great corporation, such as the Southern Pacific Company, there is an unlimited field for harmonious work between all departments. Service, the good will of everybody—shipper, traveler and employe—and revenue are the three things for which the company strives, and it is up to every one of the company's great family of forty-five thousand men and women to help obtain and retain them. The organization is divided into departments to facilitate the great amount of work performed and the service given daily by the company, and the quality of both work and service depends upon the quality of co-operation manifested.

Just now, when the European war situation has seriously disturbed the financial arrangements of every country, it is especially desirable that the men of the Southern Pacific do everything possible to secure additional business for the company. Additional business means additional revenue, and over forty cents goes out of every dollar the company takes in goes out to the men in the form of wages. So, if only for personal reasons, employes should work to secure greater revenue for the company. As travel increases, as freight shipments increase, so does the necessity for more men to handle this additional business increase.

As President Sproule said upon his return from New York a few days ago, "This is the time for us all to hold together for our mutual prosperity, for we all prosper together or we do not prosper at all." Why not all prosper together?

More "Safety First" Mile Stones.

(From the Bulletin of the American Museum of Safety.)

IN recent numbers of *Safety*, attention has been called to early orders or notices of various large industrial enterprises, having for their aim the prevention of accidents, and ante-dating the popular "Safety First" movement which is now sweeping like wildfire over the country. The last one published in the Museum's Bulletin was an order of the Central Pacific Railroad, dated 1869.

The Museum has lately been informed that a book of "Rules for Conductors," published in 1856, and containing specific instructions for accident prevention, has been unearthed by the Lehigh Valley Railroad Company. Rule 33 reads as follows: "In case of danger or doubt, always take the safe side, and bear in mind that *Safety* is the first consideration."

To the founders of the Republic, however, due credit must be given for an early consideration of safety as a matter of prime importance to citizens of the commonwealth. So we find the Honorable John Jay, first Chief Justice of the United States Supreme Court, writing in the *Federalist*, under date of Number 3, 1787, "Among the many objects to which a wise and free people find it necessary to direct their attention, that of providing for their *safety* seems to be the *first*."

A New Business Era.

(From the Chicago Traffic Club Bulletin.)

"PRESIDENT HADLEY, of Yale, as a New Haven director furnished the precedent, and now there is President Alderman, of the University of Virginia, on the board of the Southern Railway and President Pritchett, of the Carnegie Foundation on the board of the Atchison. A new field is being opened to college presidents."

The above from the Springfield *Republican* is interesting, and if the idea is carried to its legitimate conclusion (reductio ad absurdum) we will eventually reach a state of affairs decidedly novel and admirable in the original meaning of the word. We may, without placing too much strain on our mental gear, look forward to a theoretically delightful time when we shall all be engaged with matters of which we have no practical experience; when the clergymen will be devoting their attention to manufacturing whilst manufacturers turn to the art of healing; when the doctors will go in for finance (some people think they do so now) whilst capitalists take to the practice of the law and lawyers forsake the bar for the pulpit and discourse, not of litigation but of brotherly love. And to complete the cycle the R. Road men will of course occupy the chairs vacated by college presidents and professors who have deserted their cloistered lecture rooms for the board-rooms of big business. And thus a new field may be opened up to the harassed (and criminal) R. Road fraternity as well as to college presidents, and with just as much chance of success for the former as for the latter.

Are We Coming to This?

WITH the fifty-seven varieties of regulation the railroads and other public utilities have to contend with, the modern business letter may soon, of necessity, look something like the following:

"GENTLEMEN:

"Referring to your letter (See Postal Regulation, p. 126, pp. 44) of the 28th, we (a corporation organized under the laws of Ohio, certificate filed in the office of the Secretary of New York State, New York) beg to advise you that we can quote the price of $20.00 (See United States Revised Statutes, Law of 1914. Sec. 18) per ton, carload lots (See Interstate Commerce Ruling 256; see also Dicta in 128 U. S. 264, Brown vs. Pennsylvania Railroad Company 168 Pa. 267).

"This quotation is special to you (See Ruling of Department of Justice in the matter of the Brown Milling Company) and is made subject to our right to claim immunity(See N. Y. Penal Code, pp. 48). If you receive a better quotation from any one of our competitors you will, of course, advise us under the authority of U. S. Revised Statutes, p. 2247, sub. 2. We shall be glad to fill your order subject to rule laid down in leading case of Jackson vs. Cobb, 126 U. S. 232, and will ship according to your instructions (See Rule 37, New York Public Utility Commission). Yours very truly, J. P. JONES.

"Pres. Jones Mfg. Co.

"State of Ohio, County of Fairfield—ss.

"J. P. Jones, being duly sworn, deposes and says that he has submitted the foregoing letter to his counsel and has been advised that it is legal; that deponent is not a director of any bank,trust company or transportation company, that the Jones Mfg. Co. has never had its charter forfeited, nor has deponent ever been indicted by either state or federal jury.

"(Seal.) J. WHITE, *Notary Public*."

Personal

H. H. Westinghouse.

AT a recent meeting of the board of directors of the Westinghouse Air Brake Company, held at Wilmerding, Pa., Mr. Henry Herman Westinghouse was elected president to succeed his brother, the late George Westinghouse, founder of the Air Brake Company and numerous other Westinghouse interests.

Mr. H. H. Westinghouse was born at Central Bridge, Scoharie county, New York, in 1853. He attended the schools of Schenectady, and later entered Sibley College of Engineering at Cornell University, Ithaca, N. Y. Mr. Westinghouse is married and lives in New York City, having a country residence at Kidders, N. Y.

Like his brother, Mr. Westinghouse inherited from his father a fondness for mechanics and invention. He invented the well known high-speed, single-acting Westinghouse steam engine for the manufacture of which the Westinghouse Machine Company was organized in 1880. This is said to have been the only commercial steam engine invented by any of the Westinghouse family.

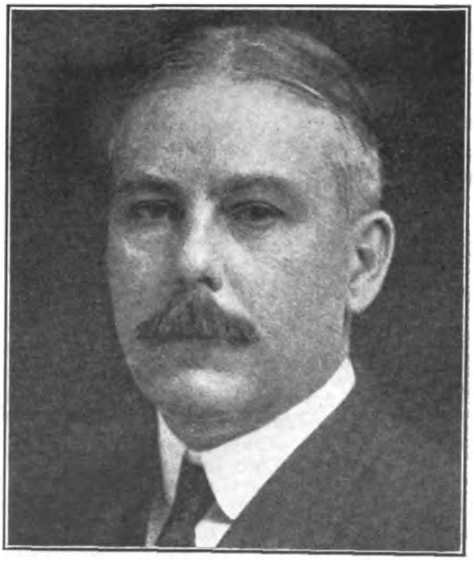
In 1873 George Westinghouse invited his younger brother to Pittsburgh to assist him in the management of the Air Brake Company, with which organization he has been connected ever since, for many years past being its first vice-president, and has been prominently identified with several other of the Westinghouse industries.

Mr. Westinghouse has always taken a great personal interest in the affairs of the Air Brake Company's employes, being an active member of the Veterans' Association of that company, and instrumental in the promotion of the welfare work and pension plan so successfully exploited by this company.

Mr. Westinghouse was also the organizer, and for a number of years, the guiding spirit in the management of the Westinghouse-Church-Kerr Company.

In his profession of mechanical engineer, Mr. Westinghouse ranks very high, his particular gift being the design of machinery in which branch he is considered an expert.

He is quite unassuming and singularly democratic with the men in the shop and is known by practically all of the employes. He was a par-

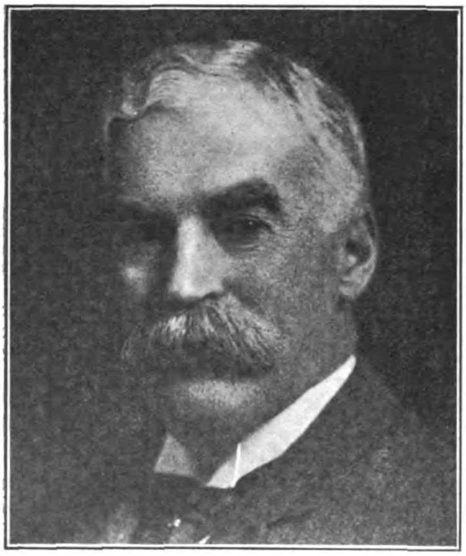


HENRY H. WESTINGHOUSE.

ticularly intimate associate of his late brother and was his most faithful lieutenant in the management of his numerous affairs.

William Hodgins Biggar.

WILLIAM HODGINS BIGGAR, who, on September 15th, was elected vice-president of the Grand Trunk Pacific Railway Company, was born at The Carrying Place, Ont., September 19, 1852. He was educated at Upper Canada College, Ont., and was admitted to the bar in August, 1880. On October 2, 1890 he was appointed Q. C. Mr. Biggar entered railway service as partner of the late John Bell, K. C., of Belleville, Ont., and in February, 1881, became general solicitor of the Grand Trunk Railway. On December 31, 1902, he was appointed assistant general counsel of the same road and on December 1, 1904, became general solicitor of the Grand Trunk Railway and the Grand Trunk Pacific Railway. On January 10, 1910, he was made general counsel for both systems, which position he held at the time of his recent election to the vice-presidency.



WILLIAM H. BIGGAR.

Fred Zimmerman.

FRED ZIMMERMAN, who has recently been elected vice-president of the Chicago, Indianapolis and Louisville Railway, in charge of the company's traffic and office at Chicago, was born July 26, 1866, at Portland, Me. He entered railway service in 1882, since which he has been consecutively to October, 1883, office boy and clerk with the Green, Kankakee, Chicago and Louisville Southern and Southern Despatch Fast Freight Lines; October, 1883, to April, 1887, clerk, Chicago and Ohio River Road; April, 1887, to February, 1890, rate and tariff clerk, general freight department, Louisville, New Albany and Chicago Railway at Chicago, Ill.; February, 1890, to February, 1890, rate and tariff clerw, general freight department, Michigan Central Railroad at Chicago, Ill., and Detroit, Mich.; April, 1897, to October 1, 1899 chief clerk, same department at Detroit; October 1, 1899, to July 1, 1900, assistant general freight agent at Buffalo, N. Y.; July 1, 1900, to November 1, 1909, assistant general freight agent, same road at Chicago; November 1, 1909, to January 1, 1911, general freight agent, Indiana Harbor Belt Railroad; January 1, 1911, to March 1 1914, general freight agent Chicago, Indiana and Southern and Indiana Harbor Belt railroads. In May, 1914, he was appointed general freight agent of the Lake Shore and Michigan Southern and the Dunkirk, Allegheny Valley and Pittsburgh railroads, with office at Cleveland, Ohio, which position he held at the time of his recent appointment.

FRED ZIMMERMAN.

Brooks Morgan.

BROOKS MORGAN, who, on October 1st, became vice-president of the Atlanta, Birmingham and Atlanta Railway, was born at Lexington, Ky., on September 22d, 1874 He

BROOKS MORGAN.

was educated at the Kentucky State University and entered railway service as clerk with the Southern Railway at Lexington in 1891. He served this road in the capacity of ticket agent and chief clerk of the passenger department at Louisville, Ky., and also as district passenger agent and assistant general passenger agent at Atlanta, Ga. Later he became chief assistant general passenger agent of the Southern Railway at Washington, D. C., which position he resigned in 1907 to take charge as vice-president and general manager of the Frank E. Block Company, the largest candy and cracker manufacturers in the South. Mr. Morgan has always been active in the social and business developments of the community in which he resided and has been president of the American Cracker Bakers' Association; president of the Biscuit and Cracker Manufacturing Company of New York; member of the executive committee of the National Confectioners' Association, and vice-president of the Atlanta Chamber of Commerce and the Piedmont Club.

H. Adkins.

H. ADKINS, who has recently been made general manager of the Tennessee, Kentucky and Northern Railroad Company, with headquarters at Livingston, Tenn., began his railroad career in the machine works and shops of the Atchison, Topeka and Santa Fe in 1897. His next position was with the Illinois Central Railroad from where he went to the Tennessee Central Railroad as assistant engineer and chief clerk and office engineer in the chief engineer's office. Mr. Adkins was with the Frisco during the construction of the Beaumont-Houston lines and was also employed for four years on the relocation construction work of the Panama Railroad. At the time of his recent promotion he was general superintendent and chief engineer of the Tennessee, Kentucky and Northern Railroad.

John Malcolm Rapelje.

JOHN M. RAPELJE has been appointed general manager of the Northern Pacific lines at East Paradise, Mont., succeeding E. A. Goodell, deceased. Mr. Rapelje was born in Chippewa, Ont., in 1857, and was educated in the public schools. He entered railway service in 1879, as a brakeman on the Grand Trunk, and then became a fireman on the Atchison, Topeka and Santa Fe. From May, 1882, to November, 1887, he was conductor on the Canadian Pacific, and from January of the following year to June, 1898, was conductor on the Yellowstone division of the Northern Pacific. He was then appointed trainmaster on the same division, and subsequently became conductor until June, 1902, when he again became trainmaster on the same division. From April, 1905, to July, 1908, he was superintendent of the same division at Glendive, Mont., and then to May, 1910, was superintendent of the Rocky Mountain division at Missoula, Mont. He was then superintendent of the Idaho division at Spokane, Wash., until April, 1912, when he was appointed general superintendent of the lines from Mandan, N. D., to Paradise Mont., with headquarters at Livingston, Mont. In May, 1914, he was appointed assistant general manager at St. Paul, Minn., which position he held at the time of his recent appointment.

JOHN M. RAPELJE.

William T. Grier.

WILLIAM T. GRIER has been appointed to the new position of general traffic manager of the Lehigh Valley Railroad, in charge of both passenger and freight traffic, reporting to Mr. T. N. Jarvis, vice-president of the company. His headquarters will be at 143 Liberty street, New York, the general offices of the company. Mr. Grier's railroad career began in 1883 when he entered the service of the Philadelphia and Reading Railroad as an office boy. Later he was with the Beech Creek Railroad, afterwards absorbed by the New York Central and Hudson River Railroad, in charge of both freight and passenger traffic. Mr. Grier came to the Lehigh Valley Railroad on June 1, 1906, as general coal agent. Two years ago his duties were extended to include some of the merchandise freight traffic and his title was made general coal and freight agent.

WILLIAM T. GRIER.

W. T. Webster.

W. T. WEBSTER has been appointed general freight agent of the Chicago, Indianapolis and Louisville Railway, succeeding O. C. Carter, resigned. Mr. Webster was born August 21, 1872, at Jackson, Mich., and was educated in the public schools of Jackson and Kalamazoo, Mich. He entered railway service in 1886 and was for four years in the accounting and traffic departments of C. K. and S. Railway at Kalamazoo, Mich., after which, from 1890 to 1896, he occupied various positions in the freight service of the Grand Trunk, Michigan Central and Pere Marquette railways in Michigan, resigning his position of chief rate clerk in the general freight offices of the Pere Marquette Railway in Grand Rapids, Mich., on May 15, 1896, to go with the Monon as their Michigan representative. He served the Monon as commercial agent at Grand Rapids, Mich., for fifteen years; was appointed general agent at Chicago on July 1, 1911; promoted to position of division freight agent at Bedford, Indiana, on July 1, 1912, and became general freight agent on October 1, 1914.

W. T. WEBSTER.

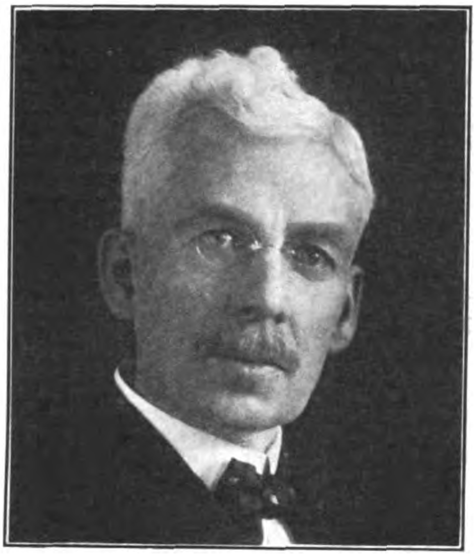
W. P. Hinton.

W. P. HINTON, who has recently been transferred to Montreal and appointed assistant passenger traffic manager for the entire Grand Trunk System, was born in Hintonburg, Ont., now part of the capital city of Ottawa, in 1871; educated in Ottawa, and entered the service of the Canada Atlantic Railway Audit Department in that city in 1887. In 1891, entered the traffic department as rate clerk and in 1898 was appointed assistant general freight agent. Appointed general freight agent in 1901 of the Canada Atlantic and the Canada Atlantic Transit Company, and in 1903, general freight and passenger agent. When the Canada Atlantic was taken over by the Grand Trunk in October, 1905, became general agent, passenger department, of the latter company in Ottawa in charge of immigration and trans-Atlantic steamship business. In January, 1907, was appointed assistant general passenger agent, Montreal, and in May, 1909, became the first general passenger agent of the Grand Trunk Pacific Railway, to which was added in 1910 the Grand Trunk Pacific Coast Steamship Company, Limited. In February, 1914, he was made assistant passenger traffic manager of the Grand Trunk Pacific Railway and the Grand Trunk Pacific Coast Steamship Company, which position he held at the time of his recent appointment.

W. H. HINTON.

Harry George Elliott.

HARRY GEORGE ELLIOTT, general passenger agent of the Grand Trunk Railway, was retired under the pension regulations of that company on November 4th, after a long and successful career. Mr. Elliott was born August 22, 1860, and entered railway service in 1882, as ticket agent of the Central Vermont Railroad

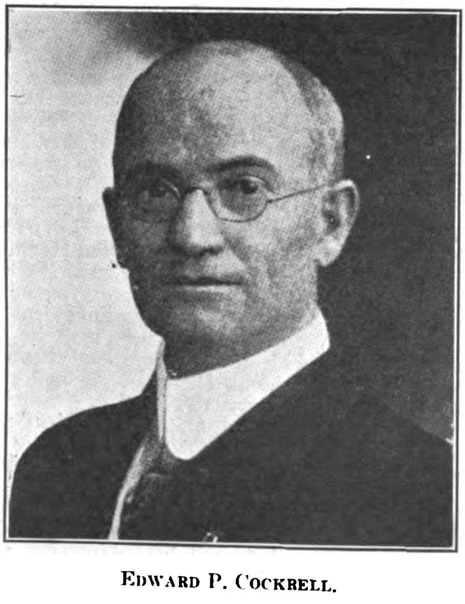


HARRY G. ELLIOTT.

at Montreal, Que. Since then he has been consecutively, May to July, 1897, ticket agent Grand Trunk Railway at Montreal; July, 1897, to August, 1899, excursion clerk, general passenger and ticket department, same road; August, 1899, to April, 1900, chief clerk same department; May, 1900, to June, 1909, assistant general passenger and ticket agent, same road; July, 1909, to June, 1910, first assistant general passenger agent at Montreal; June 15, 1910, to February, 1911, first assistant general passenger agent at Chicago; March, 1911, to date, general passenger agent at Montreal.

Edward P. Cockrell.

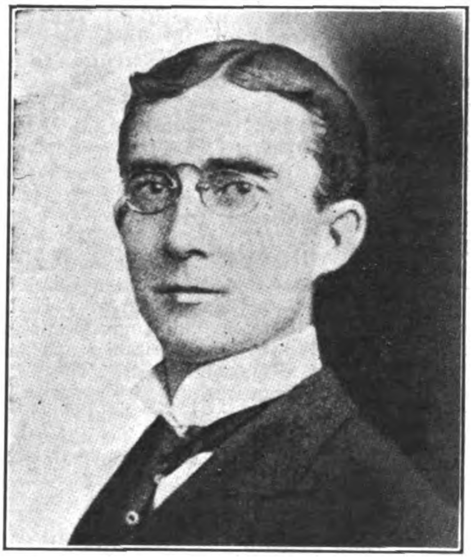
EDWARD P. COCKRELL, who, on January first, will become general passenger agent of the Chicago, Indianapolis and Louisville Railroad, with headquarters at Chicago, was born in 1870 at Kinnmundy, Ill. He was educated in the public schools and entered the employ of the Chicago and Atlantic in April, 1899. In September of the following year Mr. Cockrell went to the Chicago, Indianapolis and Louisville, with which road he has remained ever since. He was rate clerk until April, 1891, when he was advanced to chief clerk, which position he held until August, 1909. He was then promoted to assistant general passenger agent, which office he will retain until the beginning of the new year.



EDWARD P. COCKRELL.

Thomas A. Clarkson.

THOMAS A. CLARKSON, for the past seven years secretary to E. C. Lewis, chairman of the board of directors of the Nashville, Chattanooga and St. Louis, has been elected secretary of that company, with headquarters at Nashville, Tenn. Mr. Clarkson has been in railway service for 26 years, having begun railway work as a clerk in the accounting department.



THOMAS A. CLARKSON.

OBITUARY.

Charles L. Atterbury.

CHARLES L. ATTERBURY, formerly assistant and attorney to the president of the New York, Lake Erie and Western, now the Erie, died on November 10, at his home in New York. He was born on December 3, 1842, at Detroit, Mich. After graduating from Yale in 1864, he studied law in Detroit. He was in the legal department of the Erie for many years down to about 1885.

John Hall Browning.

JOHN HALL BROWNING, president of the Northern Railroad of New Jersey prior to its acquisition by the Erie Railroad, and since then senior member and a director of the firm of Browning, King and Company, died suddenly, October 26, in the Erie Railroad ferry house at the foot of Chambers street, New York. Mr. Browning, who was born at Orange, N. J., December 25, 1842, was at one time treasurer of the New York and Hackensack Railroad and the East and West Railroad of Alabama.

George A. Clark.

GEORGE A. CLARK, president of the Tennessee, Kentucky and Northern, died at the Hyde Park Hotel, Chicago, on October 11, aged 45 years. He began railway work in 1880 with the Chicago, Milwaukee and St. Paul as messenger, and subsequently was employed with that road, the Chicago, St. Paul, Minneapolis and Omaha, the Atchison, Topeka and Santa Fe, the St. Paul and Duluth the Chicago Great Western, the Great Northern and the "Soo" Line successively as clerk, agent, telegraph operator, train despatcher and trainmaster. From 1895 to January, 1903, he was with the Illinois Central as trainmaster, superintendent of the Omaha division at Ft. Dodge, Iowa; superintendent of the Springfield division at Clinton Ill., and superintendent of the Tennessee division at Fulton, Ky. He then became general manager of the Tennessee Central, and subsequently was vice-president and general manager until December, 1905, at which time he went to the New Orleans, Texas and Mexico as vice-president. In July, 1908, Mr. Clark returned to the Tennessee Central as general manager, and in October, 1909, he was appointed receiver of the Cincinnati-Nashville Southern, which office he held until he became president of the Tennessee, Kentucky and Northern in September, 1912.

Charles J. Drury.

CHARLES J. DRURY, master mechanic of the Atchison, Topeka and Santa Fe Railway, died at the age of 36 years. He was born at Chicago Junction, Ohio, and began railway work in July, 1895, as machinist apprentice for the Atchison, Topeka and Santa Fe. After completing his apprenticeship in July, 1889, he was employed as machinist for that road, the Southern Pacific, the Kansas City Southern, the El Paso and Southwestern, the Chicago, Rock Island and Pacific and other roads for seven years, becoming roundhouse foreman for the Santa Fe at La Junta, Colo., in July, 1906. He remained with the Santa Fe until February, 1913, filling the positions of general foreman at Albuquerque, N. M.; bonus supervisor of the Western Grand division; master mechanic of the Oklahoma division at Arkansis City, Kan., and master mechanic of the Plains division at Amarillo, Tex. He then became master mechanic of the St. Louis and San Francisco at Ft. Smith, Ark., and the following February was appointed superintendent of shops at Springfield, Mo. Mr. Drury was promoted to division master mechanic at Sapulpa, Okla., on September 1, just prior to his illness of typhoid fever from which he died on September 30. Mr. Drury's father, M. J. Drury, is superintendent of shops of the Santa Fe at Topeka, Kan.

Thomas Eedson.

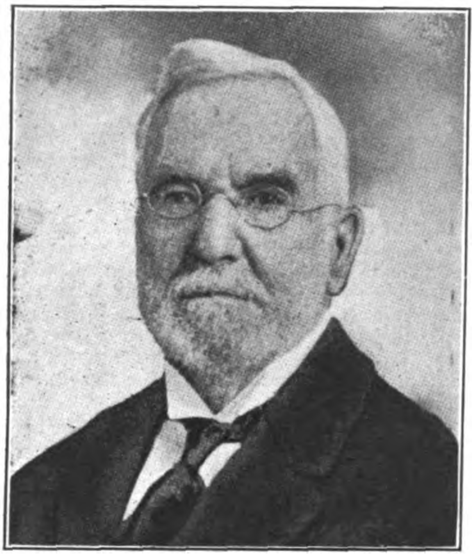
THOMAS EEDSON, formerly auditor of freight accounts and freight claim agent of the Michigan Central, died at his home in Detroit, Mich., on November 1. Mr. Eedson was born January 4, 1842, at Niagara, Ont., and began railway work in 1872 in the treasurer's office of the Canada Southern then under construction. He continued with that company as cashier from the commencement of its operation up to the time of its operating agreement with the Michigan Central on January 1, 1883, when he became a clerk at St. Thomas, Ont. In September of that year he was transferred to Detroit, Mich, as clerk in the auditor's office, and subsequently was chief traveling auditor, freight accountant and freight claim agent, until July, 1905, when he was appointed auditor of freight accounts and freight claim agent. He held the latter positions until February 1912, when he was retired under the pension rules of the company.

George A. Goodell.

GEORGE A. GOODELL, general manager of the Northern Pacific Railway, with headquarters at St Paul, Minn., died on October 3, aged 59 years. Mr. Goodell entered railway service July, 1868, when he began as messenger boy for the Chicago, Burlington and Quincy Railroad. He was successively telegraph operator, station agent and train despatcher of that road until July, 1876, when he became ticket agent of the Toledo, Peoria and Warsaw at Burlington, Iowa. He was later with the Burlington, Cedar Rapids and Northern, as telegraph operator and successively station agent, train despatcher, superintendent of telegraph, assistant superintendent and superintendent, until March, 1902, when he was appointed general superintendent of the Chicago Great Western Railroad at St. Paul. He was appointed general superintendent of the Central district of the Northern Pacific in December, 1907, and in November, 1909, he was promoted to general manager of the lines east of Paradise.

Oliver S. Lyford.

OLIVER S. LYFORD, vice-president of the Chicago and Eastern Illinois, who died on October 12, after 68 years of railroad service, was born June 19, 1823, at Mount Vernon, Maine. His record is one of the most remarkable in railroad history. He began work in January, 1846, with the Boston and Lowell, remaining with that road until February, 1851, successively as watchman, assistant baggage man, ticket agent and extra passenger conductor. He then went to the Erie as shop clerk at Dunkirk, N. Y., and from November, 1851, to October, 1855, was a passenger conductor. In October, 1860, he became joint station agent of the Erie and the Atlantic and Great Western at Salamanca, N. Y., from November, 1863, to April, 1869, was division superintendent of the latter road, and then until November, 1871, was assistant general superintendent. The following eight months he was superintendent of the Buffalo and Rochester divisions of the Erie, leaving that road in July, 1872, to become general superintendent of the Hannibal and St. Joseph, where he remained until November, 1873. From December, 1874, to November, 1876, Mr. Lyford was general superintendent of the Kansas Pacific, and in January, 1878, he became connected with the Chicago and Eastern Illinois as superintendent. He was appointed general manager in February, 1886, and in November of the following year became vice-president and general manager. He relinquished the duties of general manager in February, 1890, but retained the office of vice-president until he was formally retired on July 1, 1913. Of recent years he had not been active in railroad service, but went to his office nearly every day until his retirement, and occasionally afterward.



OLIVER S. LYFORD.

George N. Mills.

GEORGE N. MILLS, who had been real estate and tax agent of the Missouri district of the Chicago, Burlington and Quincy since 1897, died at his home in St. Louis, Mo., October 7.

George Morrison Roberts.

GEORGE MORRISON ROBERTS, formerly for many years New England passenger agent of the Pennsylvania Railroad at Boston, Mass., died on October 27, at his home in Malden, Mass., at the age of 76.

Charles Ottey Gwatkin.

CHARLES OTTEY GWATKIN, who in recent years has been engaged in special work for the Northern Navigation Company and the Grand Trunk Railway, died at Sarnia, Ont., October 9, at the age of 64 years. He was born at Lynchburg, Va., November 9, 1850, and began railway work in 1880 as agent for the Great Western Despatch Fast Freight Line at Binghamton, N. Y. In October, 1885, he was made traveling freight agent of that line at Boston, Mass., and subsequently was with the Wisconsin Central Lines as New England agent, commercial agent at Boston, and general Eastern agent at New York, until May, 1900. Later for a period of two years he was general manager of the Guatemala Government railways, and previous to his connection with the Grand Trunk and the Northern Navigation Company he was employed as traffic manager for an industrial concern in the East.

Brayton Ives.

BRAYTON IVES, formerly president of the Northern Pacific Railway, died October 22 at his country home in Ossining, N. Y., at the age of 74. General Ives was once president of the New York Stock Exchange, was subsequently president of the Western National Bank of New York, and he served as president of the Northern Pacific from October 20, 1893, to 1896. He was afterwards president of the Metropolitan Trust Company and president of the Kanona and Pittsburgh Railway.

Walter Lee McGill.

WALTER LEE McGILL, secretary of the Southeastern Freight Association, died at his home in Atlanta, Ga., on the morning of October 27th, after a confining illness of three years. Mr. McGill was 50 years old, was born in Bainbridge, Ga., and had lived in Atlanta for twenty-five years, or since his entry into the service of the Southeastern Freight Association.

He entered the railway service in 1882 as a clerk in the office of H. W. Woolf, who is now manager of the Southern Weighing and Inspection Bureau, a railroad organization in the Grant Building. Mr. Woolf was at the time auditor of freight receipts for the old East Tennessee, Virginia and Georgia Railway at Knoxville, Tenn.

From Knoxville, in 1883, he came to the office of J. J. Griffin, assistant general freight agent of the East Tennessee, Virginia and Georgia in Atlanta, where he remained about two years. He was later employed in several railroad positions, and in 1888 or 1889 accepted a position as rate clerk in the office of the Commissioner of the Southern Railway and Steamship Association, remaining with that Association and its successors until the time of his death. He was made chief clerk of the Association in September, 1890, and secretary on January 1, 1894, succeeding A. Pope. The Southern Railway and Steamship Association was succeeded by the Southern States Freight Association in 1895, and the latter was, in turn, succeeded by the Southeastern Freight Association in 1897.

WALTER L. McGILL.

Will George Van Vleck.

WILL GEORGE VAN VLECK, vice-president and general manager of the Sunset-Central lines in Texas and Louisiana, with office at Houston, Tex., died on November 10, at his home in Houston. He was born on March 5, 1857, at Elbridge, Onondaga county, N. Y. He received a common school education, and began railway work in August, 1873, as a telegraph operator with the Grand Rapids and Indiana, remaining with that company for two years. He went with the Galveston, Harrisburg and San Antonio in October, 1875, where he until 1885 was consecutively, for one year telegraph operator, four years despatcher, one year chief despatcher, one year trainmaster of the Mexican and Pacific extension, and two years division superintendent. For over two years from March, 1885, he was superintendent of the San Antonio division; he was then transferred to the Louisiana division of the Southern Pacific Company, and six months later was made general superintendent of the lines in Texas. From October, 1895, he was manager of the Galveston, Harrisburg and San Antonio, and the Texas and New Orleans, and for a number of years was also second vice-president of those lines, until his election in December, 1911, as vice-president and general manager of the Sunset-Central lines.

Edward Francis Winslow.

EDWARD FRANCIS WINSLOW, formerly president of the St. Louis and San Francisco Railroad, died on October 22, at Canandaigua, N. Y. He was born on September 28, 1837, at Augusta, Me., and began railway work in 1860. He served in the United States army during the Civil War and rose to the position of brigadier general of volunteers. From 1867 to 1868 he was the chief contractor engaged in the construction of the St. Louis, Vandalia and Terre Haute, now a part of the Vandalia Railroad. He was then to 1873 president during the construction of the St. Louis and Southeastern, now a part of the Louisville and Nashville Railroad, and during 1872 was also a contractor on the construction of the Cairo and Vincennes, now a part of the Cleveland, Cincinnati, Chicago and St. Louis. From 1875 to 1876 he was receiver of the Burlington, Cedar Rapids and Minnesota and then to November, 1879, was vice-president and general manager of the same road, which was reorganized as the Burlington, Cedar Rapids and Northern and is now a part of the Chicago, Rock Island and Pacific Railway. He was subsequently vice-president of the Atlantic and Pacific, now a part of the Atchison, Topeka and Santa Fe system; vice-president and general manager of the Manhattan Elevated Railways of New York City, and in March, 1880, became president of the St. Louis and San Francisco. The following year he became president also of the New York, Ontario and Western Railway, and in addition was president of the North River Construction Company, the chief contractor engaged in the construction of the New York, West Shore and Buffalo, now the West Shore Railroad.

Stephen W. White.

STEPHEN W. WHITE, formerly assistant secretary of the Pennsylvania Lines West of Pittsburgh and secretary of the Northern Central at Philadelphia, Pa., died on October 16, at his home in Philadelphia, at the age of 74. He entered the service of the Northern Central in 1875 as assistant secretary; two years later he was appointed secretary of the same road, and from 1881 was also assistant secretary of the Pennsylvania Lines West until his retirement in 1910 under the pension rules.

Something for Nothing; An Economic Fallacy

NOTE: The following paragraphs are taken from an address delivered before the Pittsburgh Chamber of Commerce on October 14th, by Ivy L. Lee, executive assistant of the Pennsylvania Railroad.

EVEN before the plague of war afflicted the family of nations, the United States was suffering from arterio sclerosis, in that the blood vessels of its commerce were hardening; failing to respond to the expanding business life of the country.

To-day we are confronted with the fateful possibilities to our national life of the most terrible cataclysm in the history of mankind. Though we do not participate in the struggle, we suffer with the whole world the devastations of the economic volcano.

All civilization is stricken. He is indeed a bold man who will prophesy, but this much we know: Destruction of wealth is proceeding upon a gigantic scale; production has been enormously curtailed; and demands for the world's capital are becoming ever greater and more insistent.

It is clear that in this country we have now to look forward to a period of economic convalescence. The symptoms of sickness in our business life are too plain to ignore. We must plan now to build up, to repair, to reconstruct. This country cannot and will not stand still.

Yet, at such a critical moment in the world's history, our country is,—unwitting I believe—committing against the railroad the most dangerous of business sins, namely: taking something without paying a fair price for it. To be concrete:

The Eastern railroads of the United States invested in their property in the three years 1910-1913, the sum of $600,000,000 new money. Yet at the end of the fiscal year 1914, these same companies were $90,000,000 worse off in net earnings than before the $600,000,000 had been spent.

During the past four years the Pennsylvania Railroad system increased its gross business by $34,000,000, but the increased expense of handling the business was $55,000,000. Thus the increase of $34,000,000 in gross earnings was counterbalanced by a loss of $21,000,000 in net revenues.

To remedy this situation additional earnings are necessary. Such additional revenues would supply the substance with which to develop the arteries of trade. But something else is needed. The American railway system has been built up through the enterprise and ability of the ablest business brains in the country. We pay the highest wages, the highest taxes in proportion to the investment, and, with the lowest capitalization per mile, do our business for the lowest freight rates charged on the railroads of any of the great nations.

This result has been produced by encouraging, promoting and fostering railroad enterprise. The railroad was the great constructive force in our national life. Men risked money and comfort to build railroads, that factories and farms might follow in their wake. As a great English economist has said, "In a country the most extravagant in the world, you have developed a railroad system which handles traffic more economically than anywhere else in the world."

But, is there reason to expect a continued display in our railroading of this supreme initiating and efficient activity? Only a few years ago, railroad effort was spent in devising means to give the greatest possible amount of service for the lowest rates; the tendency now is to force railroads to give the least possible service for present rates.

As a result of the vast effort and ability expended, the American railroad system had become the wonder of the industrial world, but the tendency of all governmental regulation now is to invade the field of the very management which had produced this wonderful result. No sane railroad officer can object to earnest, impartial, non-political governmental regulation, especially where the design is to prevent discrimination and the imposition of burdensome rates.

But the Federal Government and the forty-nine States are pulling and tugging at railroad managers, giving conflicting orders, imposing the caprice of theorists oftentimes, over the experienced judgment of experts. The field within which railroad managers may exercise their trained abilities is slowly diminishing. Expenditures are being arbitrarily imposed, regardless of their relative desirability.

Railroad officers are not permitted to spend the time they should give to creative activity. The president of a large trunk line railroad a few days ago, after a very busy and burdensome day in New York, remarked, "I have done a hard day's work, and yet not one single minute of my time has been devoted to the purpose I ought to be mainly serving, and that is operating the railroad."

It is no uncommon occurrence for every general traffic officer of the Pennsylvania Railroad to be away from Philadelphia at different places looking after business incidental to governmental regulation. It is obvious that such enforced activities are not creating new business nor helping to build up the country.

This invasion by government of raliroad management is one of the disquieting elements of the future. Government regulation—so sound in theory—has up to now developed this situation. The public demands improving service; the increased and improved service does not pay its way: yet the Government burdens upon railroads are undiminished; and the Government, while continually interfering with management, accepts no responsibility for the financial result. The tendency is to benumb active forces of national progress. Investors are gravely concerned, and our policies so hamper and hinder those who conduct railroads that atrophy threatens those managerial muscles, which are so necessary to the healthy development of the arteries of commercial life.

To restore the health of the railroads, to make them the efficient agency of commerce which they should be, we should provide them with ample revenues, and, in addition, prevent the Government from meddling with management. Insist that railroads play fair and perform their due obligations—yes—but outside of that, encourage and foster a spirit of enterprise, enthusiasm and energy on the part of railroad managers themselves so that American trade may continue to enjoy the service of the greatest transportation system in the world.

The Safety Problem of the Railways

NOTE: The following address was delivered by Mr. W. B. Spaulding, chairman of the Central Safety Committee of the St. Louis and San Francisco Railroad before the Congress of the National Council for Industrial Safety, held in Chicago on October 13th.

SINCE the initial construction of railroads their safe operation has been a subject of paramount concern to those upon whom devolved the manifold responsibilities of their management.

This was sought to be attained by the promulgation and enforcement of enlightened rules dictated by the combined knowledge and experience of all persons upon whom this responsibility rested.

The great success that has attended their efforts to secure safety in the transportation of passengers is manifest in the fact that during the fiscal year ending June 30, 1913, (the latest figures published) there were in round numbers one thousand million passengers transported by the railroads of this country of which but 403 were killed and but 181 of these were killed in train accidents. The rest, or 222, were killed by other causes, such as getting on and off trains; struck at stations and in other like ways for which occurrences the victims themselves were probably alone responsible. The figures given include passengers carried on freight trains.

Accident insurance companies have long recognized the very great degree of immunity of passengers from death and injury in consequence of the provisions railroads have made for their safety and evidence their confidence in the effectiveness of these provisions by giving passengers, for the same price, double the indemnity against injury they may sustain while traveling on a railroad as they can obtain against injuries liable to occur in their own homes.

While railroads have been able by vast expenditures of money on roadway and equipment and for safety devices; by educating trainmen in the knowledge of rules governing the movement of trains and being able, because of the necessity of keeping constant supervision over train movements, to secure, to a large degree, obedience to those rules to thus safeguard their passengers, it has not been possible for them to secure similar observance of rules promulgated for the protection of their employes generally from physical injury and death and whose retention in the service is of vital concern to them.

The inadequacy of rules and discipline to stop the annually increasing number of employe injury cases became apparent several years ago. A study of the situation revealed the reason to be that the employes, not the company or its officers, controlled the majority of the causes of injury sustained by workmen, and, therefore, the logical thing to do was to interest the workmen themselves in the removal of all causes of injury possible before such injury occurred, not afterwards. Not as a matter of obeying rules, (which it seems is innate human nature to resent) but because of the benefit that would come to them and those dependent upon them by so doing.

This thought originated in the mind of Mr. R. C. Richards, a veteran investigator of accident cases, was formulated into a working plan by him and tried out on the Chicago and North-Western Railroad. Its success was immediate and so great that the plan was adopted and is now in successful operation on seventy-four of the great railroad systems of this country and Canada owning 200 thousand of the 240 thousand miles of railroad in these two countries. This employe safety movement has been in operation on these seventy-four railroads varying lengths of time. On some its inauguration is comparatively recent. I am in possession of data from three of the roads on which the movement has been longest in vogue, as well as some figures from seven other important railroads which I think will definitely indicate what can be accomplished by an injury prevention movement managed by the employes themselves.

On the three railroads with a mileage of 19,000 miles and 100,000 employes and an average of three years' experience in "Safety First" work, as compared with the same period prior to the inauguration of the employe injury prevention movement, there was a decrease of 457 fatal accidents, or 21 per cent, and a decrease of 14,843 non-fatal accidents, or 23 per cent.

On seven other railroads with a mileage of about 30,000 miles, during the first six months of the present year as compared with the same six months of last year, there were reductions made in casualties as follows: Fatal accidents, decrease 205, or 32 per cent; non-fatal accidents, 4,326, or 21 per cent.

The most difficult problems of railroad safety work arise from accidents, the causes of which are not within the control of the railroad company. It is this class of accidents that supplies by far the greater number of cases to the casualty list. These accidents may be divided into two classes:

(a) To the public.

(b) To the employes.

In respect to accidents which occur to the public by far the most numerous are to those persons who use railroad tracks as walkways and those who steal rides on trains, including boys who hop on and off moving trains as a pastime. Notwithstanding the appalling loss of life and limb from these causes annually, the general public, which is profoundly shocked and indignant when life is lost or serious injury occurs in a train wreck; the sinking of a ship at sea, or in a highway crossing accident, takes no more heed of it than if as many flies had been destroyed, yet it is the general public alone that has the power to put a stop to this great loss in the productive power of the State and Nation and save the victims to lives of usefulness and contentment. The warning signs the railroads erect and maintain at great expense are a useless thing in checking track walking. This is all the railroads can do in that direction. As a part of the movement for injury prevention something has been accomplished, just how much, it is not yet possible to say in figures, in persuading boys to abandon their train hopping and turntable pastimes by talks to them at their schools, oftentimes illustrated by stereopticon views; the giving of safety buttons as prizes for learning and reciting some pertinent "Nevers"; by constructing swimming pools for their use on condition they will keep away from the cars and not play on railroad premises; by reporting them to their parents and securing the aid of town officers.

I know of several towns where the employment of some of these methods resulted in absolute stopping of these dangerous pastimes by the boys. I thoroughly believe that all that is necessary to keep a boy from indulging in dangerous sports is to provide him with safe and attractive ones in which he can expend the excess energy of his youth. This, however, is a duty to the boy that should be performed by his parents or by the community in which he lives. Railroads should be relieved of this task.

A second difficult public safety problem is the ever-increasing number of persons who while riding in automobiles are struck on highway crossings by rapidly moving trains. As there is 50 feet clear space on each side of all railroad tracks assuring a clear view of an approaching train, if one will look, and as an automobile can be stopped in ten feet even when moving at a high speed, there seems no excuse for such occurrences except the spirit of chance taking automobile driving seems to inspire in many persons.

In respect to accidents that occur to employes I am firmly of the opinion that the most difficult problem in railroad safety work is to arouse a genuine, active, heartfelt interest in the foreman in safety work (I intend that the word "foreman" shall include every man, whatever his title, who has immediate authority over and the direction of other men in their work)—an interest that is based on his own mental conviction that the prevention of injury of each individual workman will increase the efficiency and production of all, lessen the cost of production and bring personal credit and promotion for himself and therefore of the first importance to him if he desires advancement; a conviction that when he has once secured a satisfactory and competent force of men that the loss of any one of them is a loss that affects him personally and detrimentally; a conviction that will cause him to give his workmen the same supervision and care to guard them against injury that he would instinctively give to a very valuable animal or a delicate and expensive machine he might own, and for the very same reason, i. e., because it is the sensible thing to do. A foreman interested in safety work because he had the intelligence to perceive its resultant benefits, made the statement to me that "foremen would not help safety." The foreman who made this statement was an exception to it and I knew personally of several other exceptions, yet I also feel equally certain that as a general statement it was a true one. This statement did not mean that foremen generally were indifferent to the safety of their men and would not regret the injury of any of them, but it did mean that the average foreman's first concern was production—the accomplishment of the work with a despatch and at a cost that would reflect credit on him and as the ideas underlying the movement for greater safety for workmen conflicted with notions and methods of doing work to which foremen generally had long been accustomed they would be opposed to a change which, though it would eliminate risks, would, in their judgment, retard the work and cause some loss of time to the men—in a word, that risks known to foremen generally are regarded as incident to the work and usually escaped; that injuries were to be regretted after their occurrence, not before. Unfortunately it is believed by many foremen that the man who will not take chances lacks spirit, while it should be the best of evidence that the man has good sense.

Some years ago a single track car line was built by a capitalist from the outskirts of St. Louis to a suburban town with turnouts at convenient points along the line for the passing of cars going in opposite directions. On Sundays the line did a rushing business carrying the city crowds to picnic and other outing grounds. The cars had a time schedule and designated turnouts for passing. There was an understanding, however, among the motormen that if a car was not at the meeting point on time, then in order to keep traffic moving and eliminate delay the other motorman should attempt to get to the next turnout before the delayed car had passed there. In undertaking a movement of this kind a collision of two cars occurred while going at top speed. It required several hours to extricate the more than half a hundred killed and injured passengers from the debris. The owner of the line was mercilessly excoriated and denounced by the newspapers. When asked by a reporter why his motorman did not remain at the scheduled meeting point until the delayed car arrived, he replied "that he would not give much for a motorman who would not try to steal a switch." I am of the opinion that for permanently successful injury prevention among employes and still greater safety for passengers the "boss" with "switch stealing ideas" should have the first attention of the safety evangelists.

The code of safety rules promulgated by railroads give evidence that their general officers realize that a well organized and trained force of employes is essential in order that the company may serve the public efficiently and prosper itself; that the frequent occurrence of injury among their force of employes is a serious impairment of both the company's ability to render good service and its chance to prosper. If those rules were obeyed by all employes, injury cases would be kept down to the minimum and a "Safety First" organization would not be required, but these rules are too frequently disregarded and the passing years have demonstrated there is no practical way to get them obeyed—*as rules.* An unpopular rule just like an unpopular law is not enforced. Both laws and rules must have the vitalizing force of the majority sentiment of the persons whom they affect behind them to make them effective. It is little use for a special missionary to travel around among thousands of employes preaching safety and attempting to convince them the company means what it says in a rule declaring:

"The company does not require nor expect its employes to incur any risks from which, by the exercise of their judgment and by personal care, they can protect themselves but enjoins upon them and demands that they shall take the time and use the means necessary to, in all cases, do their duty in safety,"

if the "bosses" under whom these men work are not in sympathy with that rule and ignore it because they do not appreciate its importance and value to their company and themselves.

A great enthusiasm for the prevention of work accidents may be aroused by large safety meetings of workmen; by the circulation of safety literature among them; by the efforts of their associates in work who are members of safety committees and in other like ways and gratifying decreases in injury cases immediately result from the activity of workmen so aroused, but unless the immediate "bosses" of these men have been aroused at the same time and become possessed of a conviction that will stick, the good results of all this effort will not long continue. A foreman's "wet blanket" will speedily extinguish all the fire in any enthusiasm thus aroused and things will continue as before. The cook book recipe says, "First, get your rabbit," and paraphrasing I say first get your foreman. Make them thorough converts to the cause of greater safety by convincing them that their own personal interests and the real interests of their superiors and their company are best served by the absolute prevention of injury among the workmen under their charge. One of the chief tests of the efficiency and competency of a superintendent and every junior official should be the freedom of his men from injury and it should be understood that the casualty record of every such official would be given serious consideration whenever promotions were to be made. Having thus captured the "boss" the rest of the problem is of comparatively easy solution.

It is agreed that supervision and education is the straight road to greater safety—the true solution of the injury prevention problem.

The best supervisor is the foreman, because he is always on the ground and for the same reason, assuming that proper regard has been had as to his competency when selected, he is the best educator for the knowledge he imparts will be practical, of present application and permanent value and his situation such that he may not only know that his instructions are understood, but he can see that they are followed. The safety missionary, the safety committees, safety literature and prizes will be distinct and valuable aids to the foreman in inspiring the necessary co-operative spirit among all their men.

The object and purpose of the National Council of Industrial Safety is, as I understand it, to cultivate a universal spirit for injury prevention in the United States, not alone among employers of labor great and small, but in the governments of states and municipalities and among the people generally. That in carrying out this purpose the council acts as a clearing house of information, distributing weekly to all its members the safety ideas, suggestions and experiences of other members.

A safety movement of national scope is, in my opinion, needed by the railroads of this country, because such an organization can be a most potent factor in cultivating a public sentiment which will demand the enactment and enforcement of laws that will stop the great trespass evil which is responsible for more than one half the death and more than six thousand of the serious injury cases that occur annually in the operation of the railroads of this country and which the railroads are powerless to prevent.

Because such an organization can do much to check the constantly increasing number of collisions of trains and automobiles at highway crossings by persuading auto drivers and others to use the care necessary at such crossings to insure their safety.

Because the activity of such an organization will tend to modify the almost maniacal desire and demand of the public for the speeding up of passenger train schedules to speeds that are unsafe and unwarrantably expensive and to inculcate a spirit in the public for the taking of greater care when getting on and off trains and when on railroad premises.

Because such an organization having as members some of the greatest industrial establishments and railroad systems in this country gives to each member the safety ideas and experience of all other members.

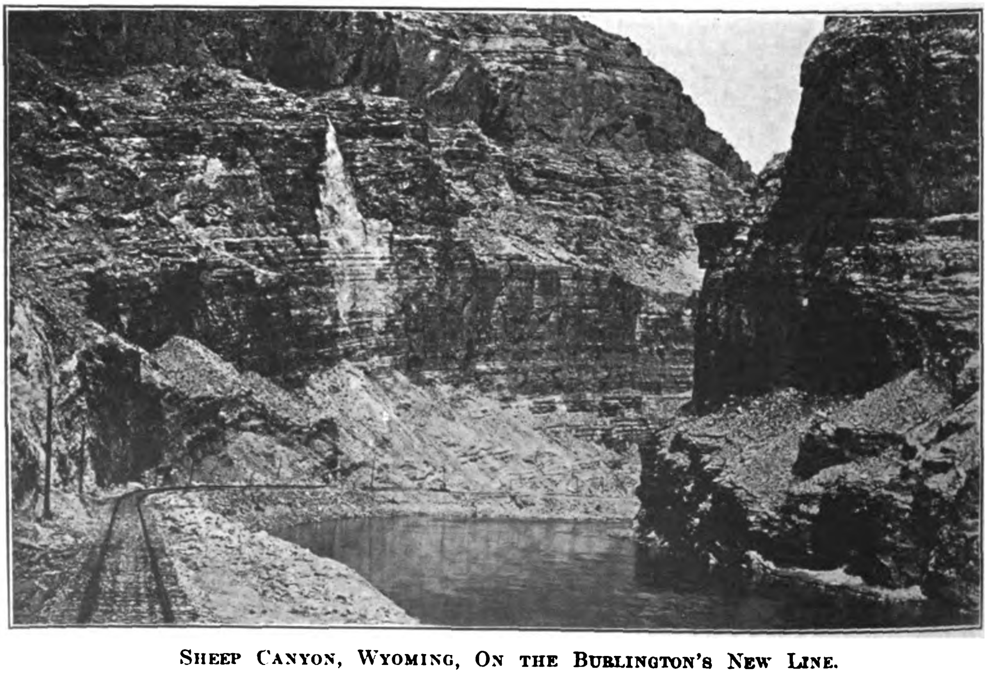
From Puget Sound to the Gulf of Mexico

NOTE: What a wonderful picture of commercial and industrial stimulation is found in the following paragraphs. This has always been the result of new railway construction but because, for the present at least, national regulative policies have checked, if not entirely stopped, new railway construction on any appropriate scale, this nation is suffering a grave misfortune which only a concerted public action can overcome. A long step in the right direction was taken at the November elections. Let it be hoped that the lesson was taken to heart and that the future will see our laws so conceived and applied that the great genius and creative force which has made the United States a leader among nations, will not continue to be arbitrarily and unfairly held in leash.

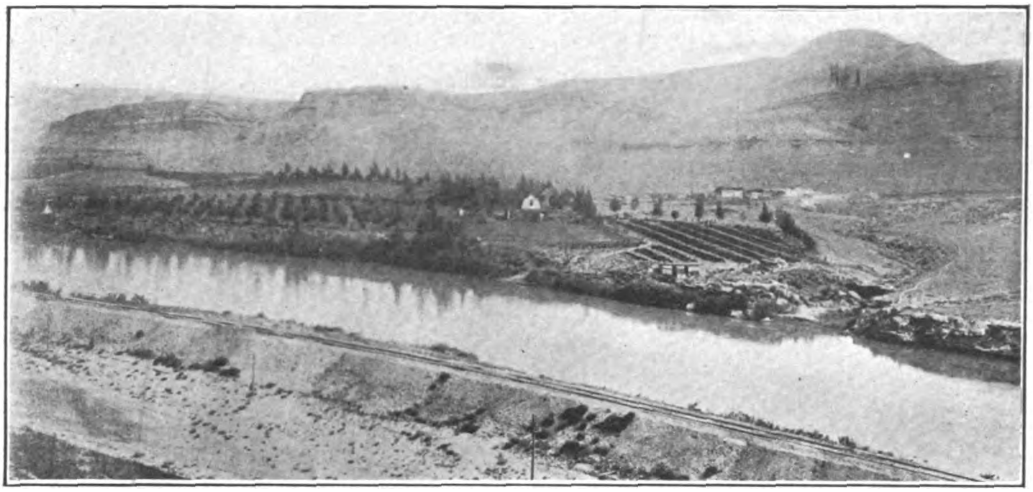
THE completion of the Burlington Railroad's last link in its Gulf-to-Sound railroad was the occasion of rejoicing in Wyoming, Colorado, and other Western States that will be benefited by this new trade artery.

The new line was officially opened Sunday, October 18 by the installation of train service between Casper and Orin Junction, Wyoming. This officially establishes the connection of the Burlington with the Colorado and Southern, giving the Hill system a direct line from Puget Sound to the Gulf of Mexico. Many new towns have sprung up along the line during the last few weeks, and townsites are being mapped out and streets laid out where there was nothing but barren prairie a short time ago. At the new town of Stephen large shipments of cattle and sheep are being made. Stock is trailed from the north and south to this shipping point over the old trail to the Montana gold fields. Fort Fetterman, near Stephen, and old Fort Phil Kearney, were built largely to protect the pioneers who traveled this trail. The Burlington's new line also follows the old North Platte trail along that stream from Orin Junction to Casper. In fact, through the connection with the Guernsey-Bridgeport branch of the Burlington, that line now has a road hundreds of miles along the North Platte, following the exact course taken by the pioneer gold seekers in the days of the California excitement.

From an engineering standpoint the new line is one of the marvels of the West. Many difficul-



SHEEP CANYON, WYOMING, ON THE BURLINGTON'S NEW LINE.



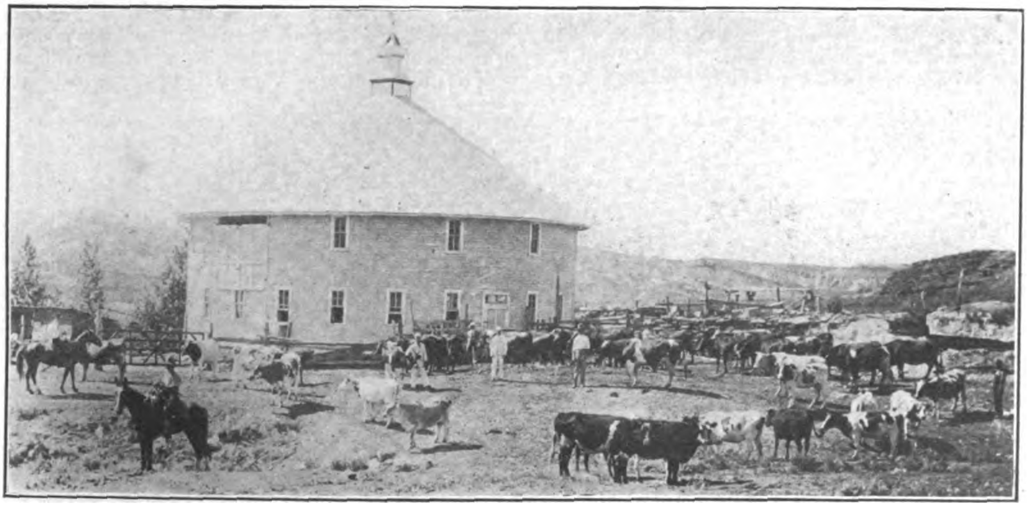
A WYOMING RANCH ON THE BURLINGTON'S NEW SOUND-TO-GULF LINE.

ties had to be overcome in constructing the last link in the Burlington's chain to the Gulf of Mexico. The divide between the Big Horn and North Platte has been pierced with an 800-foot tunnel. Work on this tunnel is still proceeding. Traffic is sent over the top of the divide via a temporary or "shoo fly" line. The tunnel is through exceptionally hard rock. The walls are being lined with concrete, applied by air pressure, something new in tunnel building.

One of the largest cuts on the system is near Douglas, Wyoming. Six hundred thousand cubic yards of earth are being taken out. This earth is being used to fill the trestles and widen the roadbed at other points along the line. The main difficulties were in the canyon of the Big Horn. This canyon is 2,000 feet deep, and the rushing stream has been traversed by only a few adventurous boatmen. It was necessary to cut trails and roads through the solid rock, leading into the canyon, before construction work could be done at many points. Some times the contractors had to spend several thousand dollars on such work before they could do any actual railroad building.

Grades have been kept to a minimum on the new line, in spite of the physical difficulties that had to be overcome. There is no grade on the line in excess of 45 feet to the mile. The rails are heavy and the trestles and bridges permanent, thus making it possible to haul the heaviest loads over the new line without any great loss. In fact it is claimed that the new road will have by far the lowest maximum grades of any line from Puget Sound to the Gulf of Mexico. From the new town of Arminto, 6,028 feet above sea-level, the highest point on the Big Horn-Wind River divide, it is claimed that an engine will travel to the Missouri River or to the Gulf by its own weight.

It is figured that the new line will assume increasing importance as Panama Canal trade is extended. Gulf exports, it is thought, cannot fail to cut an increasing figure in the commerce of the nation. It is pointed out that with a "tonnage" line from the Sound to the Gulf, the Burlington will be able to land the products of the



RANCH SCENE IN THE BIG HORN VALLEY, ALONG THE NEW LINE.

Northwest and the livestock and wool of Montana, Wyoming and Colorado at Galveston at very low rates.

In addition to its importance in binding the Puget Sound and Gulf States closer together, the new line is the first to traverse Wyoming from north to south. Wyoming has been retarded in development largely because it has had no north and south line. In order to reach the capitol at Cheyenne, a legislator living in the northwestern part of the State has had to travel in a semi-circle, through the corners of Montana, South Dakota, Nebraska and Colorado.

The Colorado and Southern built to Orin Junction over 20 years ago, but got no farther, owing to financial difficulties. A few years ago James J. Hill acquired that road, no doubt with the idea of linking it with the Burlington. It has taken fourteen years to bring the two roads together. The first work on the new link was begun in 1900 when the Burlington built south from its main line in Montana to Cody, Wyoming. From Frannie, Wyoming, on the Cody branch, the line was pushed down the Big Horn to Basin, Thermopolis and other towns, until Casper and Orin Junction finally were reached this year. The work has been halted many times, but the goal never has been lost sight of.

The new line penetrates a picturesque and interesting country. It will shorten passenger travel by the Burlington's Denver gateway to the coast. It will open one of the greatest health resorts in the country at Thermopolis, where wonderful hot springs have been set aside by the Government. These hot springs are the largest in the West, if not in the world. They were used by the Indians for generations, and were ceded by the Shoshones, whose great chief Washakie insisted that the Government should reserve a mile square, including the largest and finest hot springs, for the use of the people. Thus the public has an Indian chief to thank for this great natural wonder which it is prophesied will in time rival the Hot Springs of Arkansas in popularity among health seekers.

The canyon of the Big Horn is one of the scenic wonders of the West. While its walls are not as precipitous as those of the Royal Gorge, it is brilliantly colored.

At Worland, on the new line, is located the experimental farm of Prof. B. C. Buffum, whose achievements in plant breeding have challenged the attention of scientists all over the world. Prof. Buffum has raised more than seventy varieties of alfalfa on his farm in the Big Horn Valley, besides developing the new forage crop, emmer, which is being extensively planted in the irrigated States.

The new line penetrates the oil fields of Casper. Other oil fields are being opened at various places along the line. The rise of Casper from a wool shipping center to one of the chief oil producing markets of this country is a romance in itself. Oil will be used as fuel on the new line, stations being established at Casper and Greybull.

The building of this new line across Wyoming is the only important railroad development in the West in several years. The line was pushed to completion at a time when railroad construction was almost dormant, testifying to the faith of the Burlington in the future of this Sound-to-Gulf link.

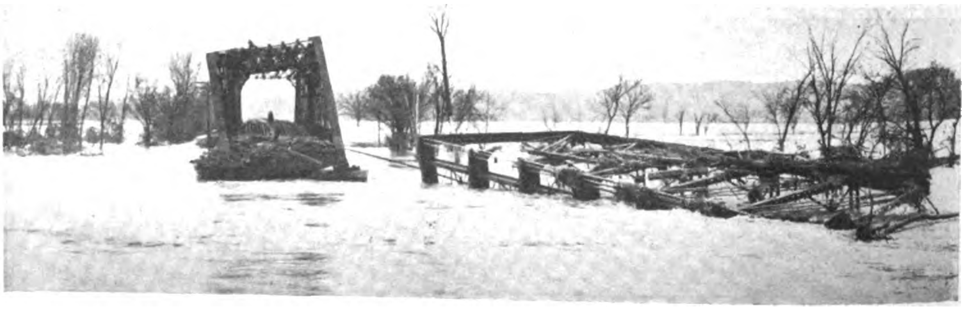
A Remarkable Engineering Feat

ON September 22, 1914, another romantic chapter in the story of the floods of 1913, and how they were met by the Pennsylvania Lines, was completed. On that day a new three-span truss bridge, 720 feet long and weighing 7,000,000 pounds, was "rolled" into place at Tyndall, Ohio, in seven minutes, without interrupting traffic. Eleven minutes after the last train crossed the bridge in its temporary position another moved over it in its permanent place. Between the breaking of the rails and reconnecting them 10 minutes and 17 seconds elapsed.

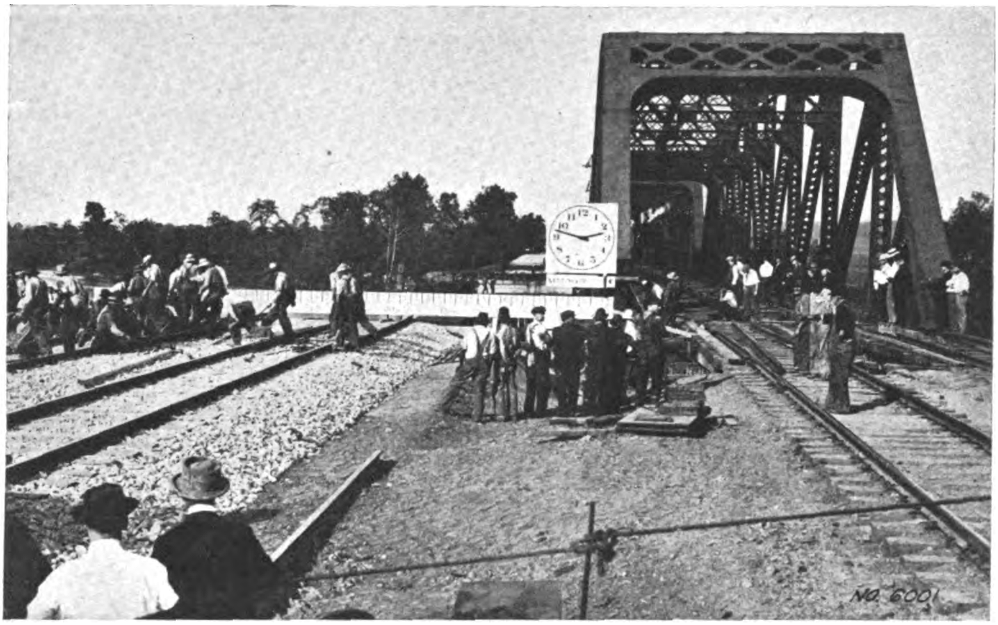
The bridge is the longest and heaviest ever moved into place by the method employed, and the speed with which the great structure was shifted set new records for engineering work of this kind.

The old Bridge 100 crossed the Muskingum River at Tyndall, Ohio, about four and one-half miles west of Coshocton and about 64 miles east of Columbus. It was erected in 1900—a four-truss bridge, resting on three piers and two abutments. From end to end it was some inches over 614 feet long and it weighed 2,500,000 pounds, which would still be ample for the traffic to-day.

The floods of 1913 tore Bridge 100 into pieces.



APPEARANCE OF BRIDGE IMMEDIATELY AFTER FLOOD.



New Bridge Over Temporary Line. Weight 7,000,000 Pounds.

So great was the velocity and so immense the volume of water that scoured out the bed of the Muskingum River and undermined the foundations of the bridge, that the west pier was destroyed and the middle pier was damaged enough to cause it to settle nine feet on the upstream side and five feet on the other. At the height of the flood the water rose to within 1.6 feet of the grade of the rails.

The two trusses at the west end of the bridge fell into the river. The middle east span settled with the middle pier, while the span at the east end of the bridge remained intact. This occurred on March 25, 1913.

Because of many washouts in both directions, as a result of the great flood, it was April 13th before a temporary bridge could be built.

Once traffic was moving again over Bridge 100—moving very slowly, it is true—the railroad engineers devoted themselves to the task of designing a bridge that would defy the force of another flood such as that of March, 1913.

Soundings taken in the Muskingum River, under Bridge 100, after the flood, showed that the bed of the river had been washed out in some places 18 feet below its former level and in other places 15 feet. The area of the waterway beneath the bridge—that is, the space between the bed of the river and the floor of the bridge, through which water could flow—had been 16,328 square feet. With the passing of the flood it was found that this had been increased to 18,990 square feet by the cutting away of the river bottom.

The engineers decided to plan a structure which, in addition to withstanding the floods, would provide extra strength to meet the growth of traffic for many years to come. Hence the new bridge was designed not only to be higher and longer than the old, but also of more than twice as heavy construction.

A greater waterway area was one of the first features decided upon. The flood, itself, had accomplished something in this direction by scouring out the river bed, but the plans for the new structure provided a further increase to 21,672 square feet, to give a larger opening for the free passage of swollen waters. The grade of the rails was raised three feet, and the total length of the bridge, from face to face of the abutments at either end, was increased to 721 feet. The new bridge was planned to be built in three spans, instead of four, so that only two piers would oppose the flow of water, where there had been three under the old structure.

As the river bed was found to consist of sand and gravel to a depth of 100 feet, the engineers provided for pier foundations 43 feet below low water, about 75 feet under the tracks. The foundations for the abutments were carried to a depth of 31 feet below low water.

In laying the new foundations, the workers in the pneumatic caissons found a curious relic of the flood, a little child's wagon in the sand 58 feet below the tracks.

The three 240-foot truss spans which form the superstructure of the new Bridge 100 were erected on temporary, but very strong, supports 45 feet down stream from the location of the old bridge. As soon as the new spans were put together, traffic was diverted to the new bridge in its temporary position. The old repaired structure was then demolished.

The masonry work on the new piers and abutments was finished, except for some details which awaited the moving of the superstructure into place, in December, 1913. The work of putting together the three trusses was started in the same month. All of the material had been delivered by the following March and the spans were complete to the last rivet on September 22d. They were immediately moved to their permanent places.

The three spans were shifted as one structure, with ties and rails in place. So fine was the cal-

New Bridge After Being Moved to Permanent Location. Time of Transfer, Eleven Minutes.

culation that, despite the rapidity of the operation and the great length of the bridge, nothing was disturbed in the slightest degree and the rails on the spans made strikingly perfect alignment with the tracks of the approaches at either end.

The spans were moved from their temporary supports to the adjacent piers and abutments on 2½-inch steel rollers, resting on rows of 85-pound steel rails laid for that purpose. Each span was carried on "sand jacks," small steel boxes filled with fine dry sand. The purpose of the "sand jacks" was to hold the spans, during the rolling operation, somewhat higher than their final positions, so that, when the bridge was in place, the sand could be allowed to run out and the trusses would settle gently into their permanent "shoes."

The motive power was supplied by two derrick cars, equipped with hoisting engines. The cars were placed end to end on the middle span, and anchored. From each of the four drums of the hoisting engines steel wire cables were led through a series of many-sheaved steel blocks, attached to various points on the spans and to wooden "deadmen" built at the upstream ends of the new piers and abutments. In effect, the spans and their permanent foundations were pulled together, but, of course, only the spans moved.

Owing to the very careful arrangements, the power required to roll the heavy spans was surprisingly small. The greatest pull on any one of the three trusses was calculated at not over 15,000 pounds, although the entire structure, with rails, equipment, and the moving machinery, weighed more than 7,000,000 pounds. The steel cables were not even pulled taut.

An ingenious "telltale" arrangement, constructed on piano wire, pulleys, weights and a scale graduated in feet and inches, in plain sight of the person directing operations, guarded against one span moving faster than another, which would disturb the alignment.

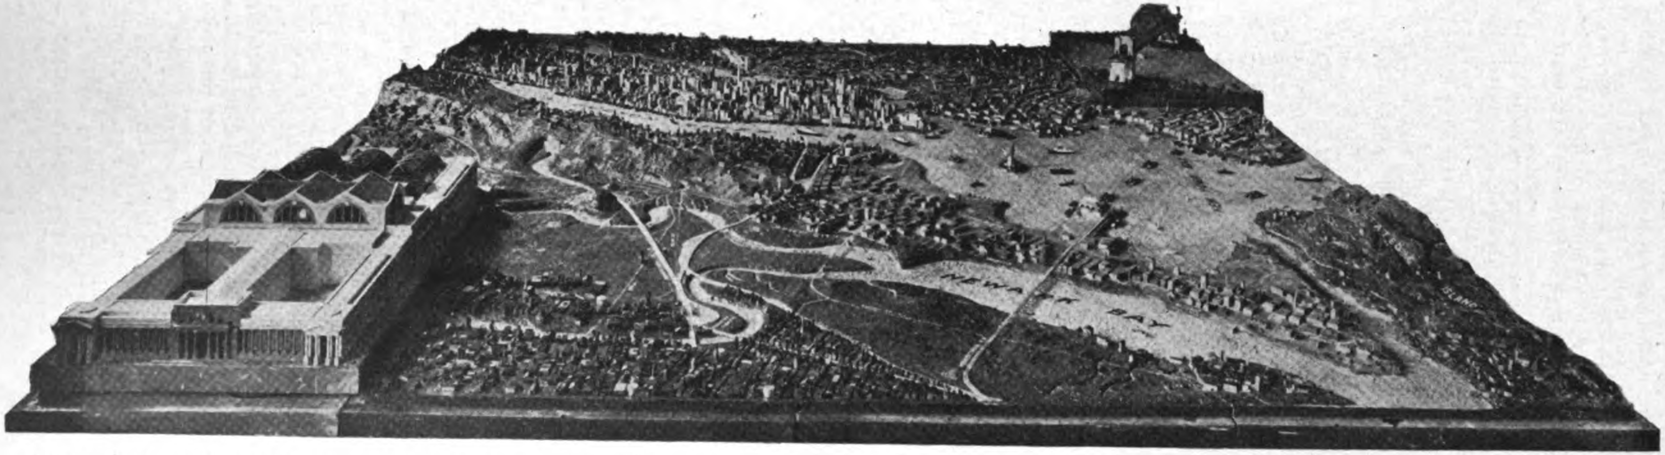
A huge clock was erected at the west end of the bridge, over a scale, with a pointer, showing the number of feet the structure had to be moved. This not only graphically illustrated the progress of the work, but rendered possible photographic records of the various stages of the operation.

The last train to cross the bridge in its temporary position was a fast westbound mail. As soon as it cleared the bridge, the tracks were broken and within two minutes the bridge began to move. The actual rolling required between six and three-quarters and seven minutes. The time during which the tracks were disconnected, 10 minutes and 17 seconds, was half what had been counted upon.

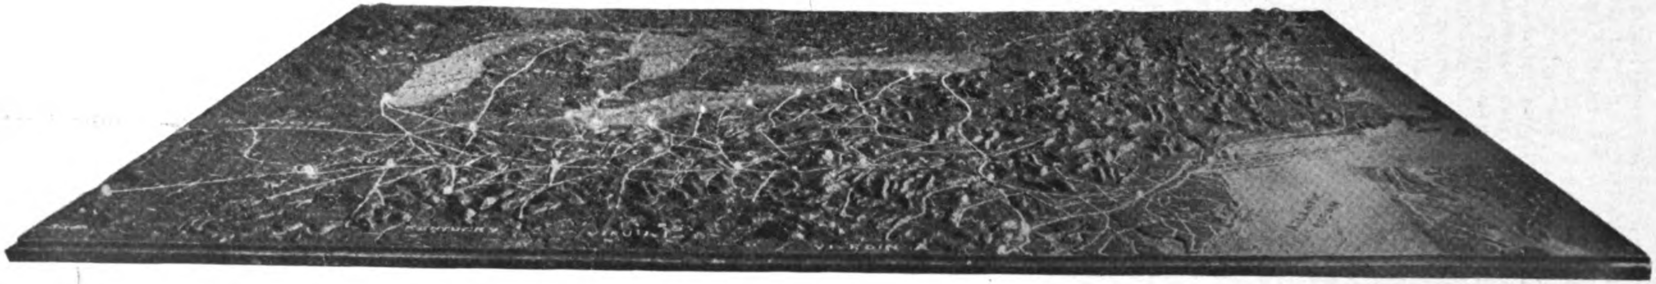
So swiftly and smoothly did the great bridge glide into its permanent place that the several thousand persons who had come from miles around to witness a rare engineering feat, for a moment hardly realized that the work was done.

The Pennsylvania System Exhibit at the Panama Pacific Exhibition

THE Pennsylvania System exhibit at Chicago was historical; at St. Louis, scientific, at the Panama-Pacific International Exposition, 1915, the exhibit will be practical and popular and will serve to bring before the eyes of the thousands of people who will help celebrate the opening of the Panama Canal a true educational picture of density of population, traffic and industry served by the Pennsylvania System. The exhibit will consist of models of New York City



Model of New York City and its Surroundings to be Exhibited by the Pennsylvania Railroad at the Panama-Pacific International Exposition. This Model is 26 feet Square and is a Faithful Reproduction of the Nation's Greatest City Including its Wonderful Harbor and Surrounding Territory. On Diagonal Corners are Shown Reproductions of the Pennsylvania Station in New York City and the Hell Gate Bridge.



Relief Map of the Pennsylvania System to be Exhibited at the Panama-Pacific International Exposition. This Map is 42 x 26 feet and Took Two Engineers Three Months to Lay Out the Proper Drawing Showing the Entire System, Cities, Mountains and Lakes. This Drawing was Used as the Basis for the Construction of the Relief Map Which Required the Services of Cabinet Makers, Modelers, Painters, etc., Working for a Number of Months Under the General Directions of Henry Kabierske of Philadelphia.

and surroundings, with the Pennsylvania Station in the heart of Manhattan Island; of the Pennsylvania System from the Mississippi River to the Atlantic Ocean and from Duluth to Norfolk; and two railroad stations, the Union Station at Washington and the proposed Union Station at Chicago. A unique motion picture auditorium of two Pennsylvania all-steel passenger coaches will also be on exhibit wherein will be projected various journeys from the Western gateways of the Pennsylvania System to New York.

Henry Kabierske, of Philadelphia, who has contributed his advice and services in connection with the St. Louis Exposition, the Nashville, Tennessee, Exposition as well as the construction of floats for the Founders' Week Pageant at Philadelphia in 1907, constructed the models, assisted by cabinet makers, modelers, painters, electricians and various other artisans, and after a year's work there has been completed a piece of work which is considered by many as a masterpiece of its kind. In fact, the map of the Pennsylvania System, with hills and valleys, with rivers, bays and lakes is without question the largest ever constructed, it being 42 x 26 feet.

The model of New York City is twenty-six feet square. One can gaze upon this gigantic city and its beautiful harbor, the gateway of American commerce, as if from an aeroplane. The prominent skyscrapers are faithfully reproduced. The East River bridges are reproduced to an exact likeness, while all transportation lines in and around the city are shown along with the Pennsylvania Railroad's entrance to New York and the extension to Long Island.

The floating craft in and around the harbor are reproduced as is that monument which first strikes the eye of the foreigner before stepping on America's shores, the Statue of Liberty, and as shown on the model, carries in the hand as a torch the smallest electric light ever used, while the principal buildings in New York are so arranged electrically that the metropolis can be represented at night as well as by day.

The model is worked out to minute detail in dimensions and colors. All the prominent buildings were made from architect's drawings, while all the elevations, palisades, bridges, river and bay levels were arranged after the proper plans of the Government and approved by the engineers of the Pennsylvania Railroad. The model shows on the Jersey side the City of Newark, Manhattan Transfer and the Bergen Hill tunnels. Across from these is seen the magnificent Pennsylvania Station in the heart of the New York City. Across from this station, over East River, The Sunnyside Yard is shown, one of the most complete railroad passenger yards in the world.

At diagonal corners are shown reproductions of the Pennsylvania Station in New York City and Hell Gate Bridge. The latter is being built by the Pennsylvania and the New Haven Railroads for a through service from the West to Boston and New England. The main span of the bridge is 1,000 feet and is 240 feet above the water level. It is a four-track railroad bridge, the construction material being concrete, stone and structural steel.

One gets a good idea of the magnitude of the Pennsylvania System in viewing the relief map. It is to the approximate scale of two miles to the inch and shows important stations touched by the railroad, the System being shown by a line in silver leaf. The main cities are indicated by electric globes bearing the name of the respective city and its population. Capitals of the varous States and important historical places are marked by flags.

It took two engineers three months to lay out the proper drawing showing the entire system, cities, mountains and lakes. All this was executed to scale, from the Government's geographic maps, to the smallest detail possible. Miniature steamships represent the Pennsylvania System Great Lakes steamship line, known as the Anchor Line.

One can form a good idea of the exhibit by the fact that it required over 200 packing crates and boxes for transportation. The model of New York City being made up of twelve sections while the map of the Pennsylvania System is composed of twenty sections.

Models will be shown of the Washington and Chicago stations. The former, electrically illuminated, shows the station classic forms. The lanterns in front of the building shine brightly while the two fountains before the edifice will also be put into action by electric motors. The Chicago station, not yet constructed, will be depicted to the San Francisco people for the first time, the model itself being designed to represent one of the most beautiful edifices in the world.

The two Pennsylvania all-steel passenger coaches which will be used as a motion picture theater, have been constructed at the Altoona shops. They are to be of the highest type at an approximate cost of $13,000 each. At the present time the Pennsylvania System has in use about 3,000 of these all-steel passenger coaches and nearly 400 under construction, the Pennsylvania on January 1, 1914, owning more than one third of all the steel passenger equipment cars in use in the United States. It is the intention to place these coaches, at the close of the Exposition in regular service on the Pennsylvania System. It may also be mentioned that the first motion pictures ever shown to the public were within a railroad passenger coach.

The two cars will be joined under one roof and the arrangements of the theater will give the patrons the feeling that they are riding in Pennsylvania standard equipment for they will see railroad scenes and railroad activities, just as if they were making a trip over the System. As the pictures are shown on a screen, the lecturer will deliver the story.

The patrons of the theater will be provided with a ticket of admission without cost with a detachable souvenir coupon.

The exhibit in its entirety will be a practical description of the Pennsylvania System, showing every characteristic of the road from an educational standpoint. It will be under the direction of Mr. George D. Dixon, vice-president in charge of traffic, Pennsylvania Lines East of Pittsburgh, and Mr. D. T. McCabe, vice-president in charge of traffic, Pennsylvania Lines West of Pittsburgh. Mr. H. T. Wilkins, special agent, traffic department, has had direct supervision of the preparation of the exhibit and he will also supervise its installation and display. Mr. Wilkins will be assisted by courteous attendants, uniformed as trainmen, who will look after visitors and distribute an illustrated booklet describing the exhibit.

Make Your Times Better—Now.

(From the "Railway Employes' Journal," Official Organ of the National Brotherhood of all Railway Employes.)

ONE of you—Frederick D. Underwood, who began with a brakeman's job on the Chicago, Milwaukee & St. Paul and now holds the president's job on the Erie—put it good and straight in a letter written lately to another of you, Engineer John Wonderly, saying:

"Too many railroad men are following the wrong wagon—their true friend is the thing that gives them the money—their livelihood. It is said that all things finally work out for good; perhaps the assaults of the rabble on railways will solidify the men and the company. I hope this will be the case."

"Most railroad men," this one of you might have written, "are not following any wagon—are doing nothing to keep the wreckers from putting their own wagon into the ditch."

But just as public opinion has waked up, so have you. And you can make public opinion get up and do something for your industry and for you.

Two millions of you in the United States. Why, public opinion has simply got to get up and get busy when you say so, because you are yourselves a big, strong part of public opinion. On any railroad question you hold the balance of power—you can be public opinion.

Whenever you say the word this business of railroad jamming will get out of the way and let your business go ahead.

You are getting ready to say the word. Your response to the talks in this Journal shows that—your ready response to the plain talk of working railroad men to working railroad men.

Don't let anybody lull you to sleep again in the notion that your industry is getting along all right—that there never was anything the matter with it except the crookedness of some railroad financiers and the greed of some others.

There's a railroad crisis on right now, worse than any your industry ever met or feared. European war did not make this cause, but only sharpened it.

Twenty-five years of demagogism made this crisis—twenty-five years of political and professional "regulation," of restriction, of increasing taxes, of decreasing revenue—twenty-five years of unending, unscrupulous campaigning by the government ownershippers, who would make a tumble-down wreck of your industry and liveried flunkies of you!

President Wilson has confidence that public opinion will compel justice to be done your industry. So it will—by and by.

Justice will be done now to your industry—"the one common interest of our whole industrial life"—if you, brother railroad men, demand it for your own sake—not otherwise.

It will always be "by and by" for your industry and for you, brothers, until you make it "now and now."

The Patriotism Displayed by British Railway Employes.— Reports from abroad indicate that practically ten per cent of all railway employes in England, Ireland and Scotland had joined the colors by the middle of October. With only British returns available, 54,276 railroad men on twenty-four roads had left to enter either the army or navy. The total number of employes in all English roads just previous to the war, was 643,135.

A similar proportion of railway employes entering military service in the United States in time of war would afford an army of 200,000 men. On the London & Northwestern alone 9,400 men have left, while the Great Western is second with 7,600, the Midland third with 6,700 and the North Eastern next with 5,000.

To preserve adequate operation of the railways it has been necessary for the war office to issue an order to all recruiting officers "that no railwayman is to be allowed to enlist unless he presents a written statement from the railway company which employs him to the effect that he has approached the head of his department and has obtained the necessary permission to enlist." The companies have given notice that "wherever it is possible to do so without impairing the efficiency of the working of the railway, permission to enlist will be given, but . . that any man who is required for the working of the railway is serving his country just as well by remaining at his post as he would be if he enlisted with the forces."

From the employes of British railways, special corps of railway troops have been recruited to assist in restoring and maintaining rail communications in France with the allied armies at the front. These consist of maintenance men, linemen, telegraphers and others similar, while two companies consist of engine drivers, signal men, guards and switchmen, to assist a body of 15,000 French railway men already organized for railway work of a military nature.

Similarly, according to advices to the Bureau from Berlin, 5,000 men from the Prussian-Hessian state railways alone had been sent by early September to operate railways in occupied Belgian territory.

"If it is not granted to these men," says an appeal to German railway men, "to strike down the enemy by weapons in the hand, still they are called to a great work. The farther our valiant army presses forward triumphantly into the hostile land, the harder becomes maintenance of communications with home. What a work they must do! Conveyance of troops, supplies, munitions, hospital trains, in addition to the numberless trainloads of prisoners!

"Our men of the winged wheel must do their utmost, that railway operation in the hostile territory may fit to the smallest detail. They are called like pioneers of Germanism, to work in the conquered realms, and to bring to the heated population a conception of German discipline, customs and order!"

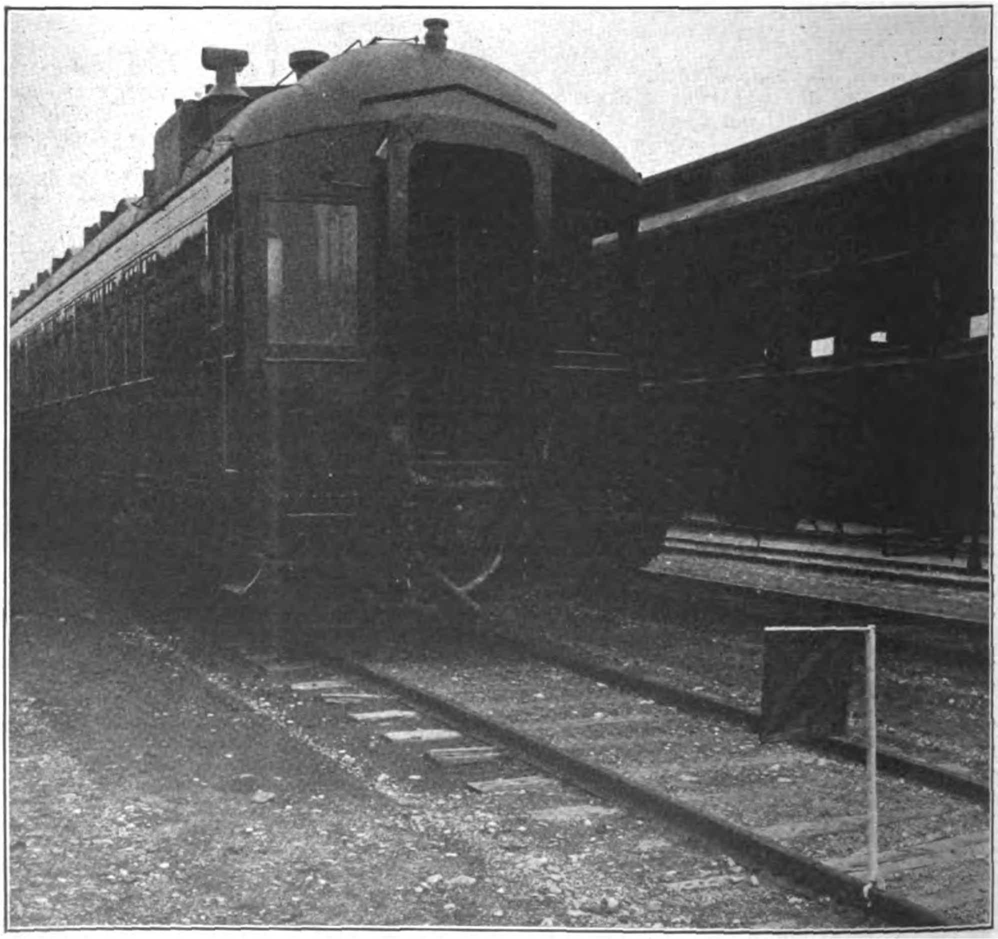
"Writers have alluded to this war," says an English commentator, "as a 'motor car war' and a 'petrol war.' It would be as accurate to call it a 'railway war,' since both forms of transportation are playing an enormously important part . . . aside from the importance in mobilization. The press censorship has prevented much from becoming known. . . The strategy of the German-Russian campaign has been modified by the general layout of the railways in the coastal districts concerned. A recent article by a German military expert pointed out how the French railways, particularly the fact that the lines from Paris to the North were so numerous, enabled the allied army in France to move its troops very rapidly."

The Blue Flag Holder of the Canadian Pacific

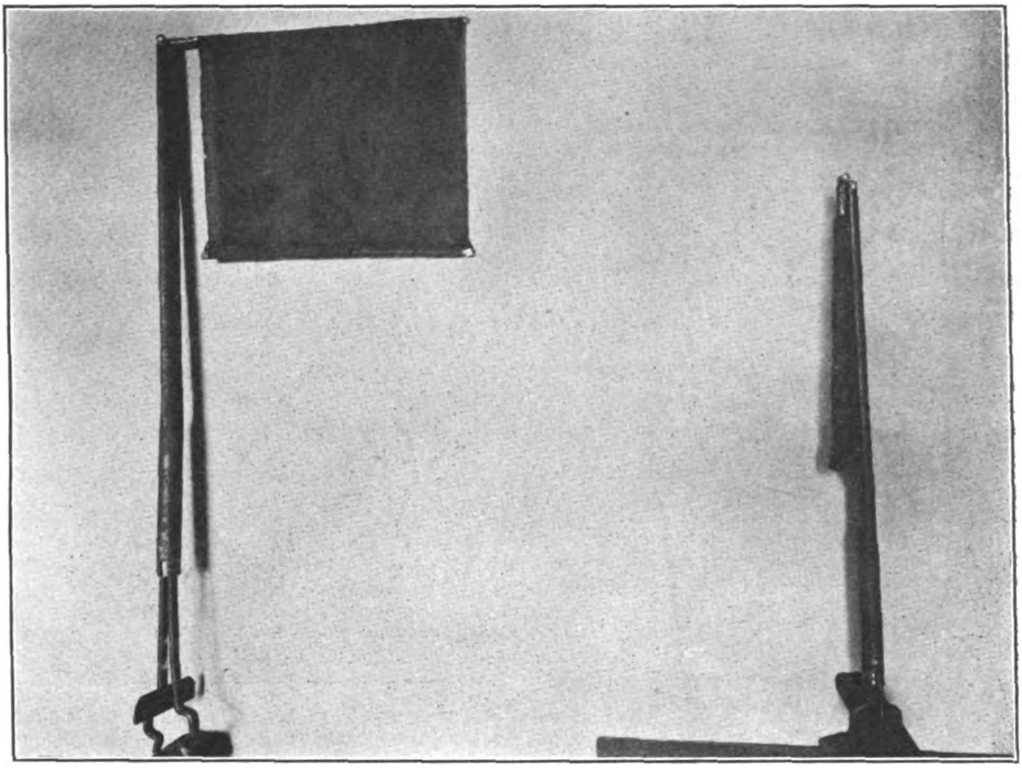
THE Canadian Pacific Car Department is using a blue flag holder that appears to meet all requirements. The illustrations show the appearance and general construction. The sizes of materials used are as follows: Spring clamp for gripping rail head is made of one piece of ⅝ in. half round, the foot piece used for forcing the clamp over the rail is 1½x⅛x4½ ins., the mast is made of 1¼ ins. O. D. seamless tubing 1-16 in. thick, 32 ins. long. This is cylindrical for a distance of 9 ins. from the lower end and above this point one side is pressed in so that the cross section is crescent shape, thus forming a recess that permits the flag when wrapped around the cross bar to be folded so that it is very compact and convenient to carry. The flag is secured to the cross bar by means of a light strip of metal and four small stove bolts and the lower edge of the flag is weighted with a piece of steel bar, thus ensuring the full area always being in view regardless of wind conditions. This is an important feature as the ordinary flag attached to a perpendicular mast hangs limp when the wind is not blowing and if attached to a stick that is horizontal, the flag may not be very conspicuous if the wind is blowing strongly from the direction of the observer.

At night it is equally as useful as in the day time, the only change required being to wrap the flag around the cross bar and hang a lantern over the bar, the folds of the flag serving to prevent lantern from creeping off.

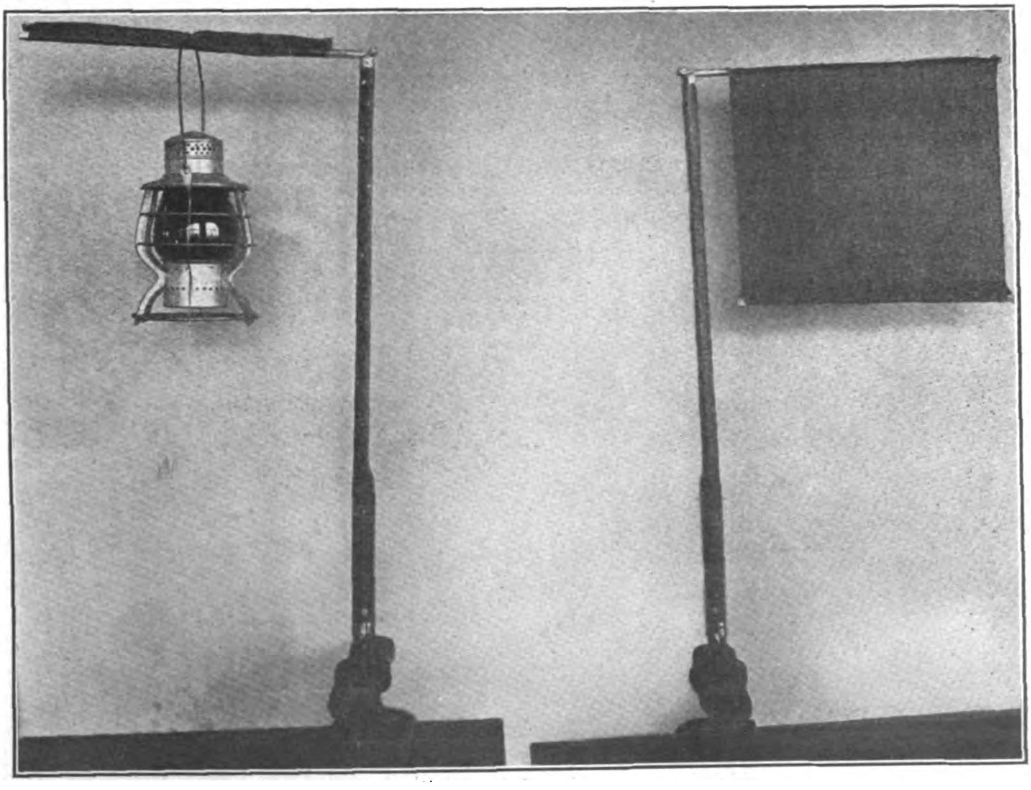
One of the most important advantages of this arrangement is the fact that makes possible the inforcement of rules requiring that flag be located a specified distance away from the car that it is protecting. This is important, as flags displayed against a dark object, like a car painted black, are not as conspicuous as they would be if placed some distance in front of same.



THIS ILLUSTRATION SHOWS HOW THE CANADIAN PACIFIC EMPLOYS BLUE FLAG ON RAIL IN FRONT OF COACH. THIS CAR IS NOT UNDERGOING REPAIRS.



Two Views of Blue Flag Holder Showing Spring Clamp Withdrawn from Mast and Holder in Position Ready to Carry.

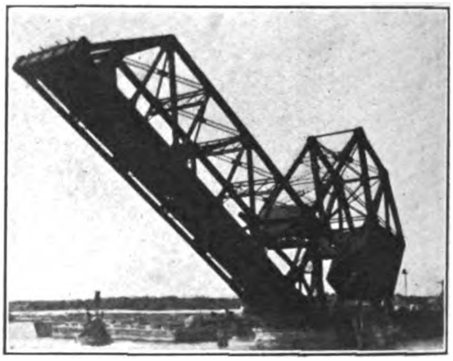


The Night and Day Arrangements for the Employment of the Blue Flag Holder.

The Cape Cod Canal

NOTE: The following paragraphs are taken from an address delivered by Captain J. W. Miller, vice-president of the Cape Cod Construction Company, before the New England Railroad Club, on October 13, 1914. As recorded in the RAILWAY WORLD for June, this canal was finally cut through on April 21st, but was not ready for actual service for some weeks later. The canal, which is eight miles in length reduces the water journey from New York to Boston from 326 miles via Pollock Rip to 260 miles via the canal through Long Island Sound. The distance from New York to Boston via Nantucket Light, is 402 miles. It will thus be seen that the economy in distance is very marked. At the present time, only vessels of light draught are operating through the canal, as it has not as yet, been dredged to its full depth. When completed it will accommodate the largest vessels engaged in coastwise trade.

ELEVEN million tons of coal are to-day coming around Cape Cod, and thousands of tons of lumber from Maine and the Carolinas. The Erie Canal will be open next year, and the ore of Duluth must float through that channel, up Long Island Soumd, and through an interior waterway at Cape Cod. What the railroads may lose through the lack of crude material from the West, they will gain by the greater activity of their local industries. What is true of the argument for water transportation between the West and the East is equally evident between the North and South, if an interior channel can be constructed back of the coast as far as Florida. There is not enough money even in our rich Governmental treasury to pay for the excessive cost of canals back of Hatteras. If the Cape Cod Canal can be proved to be a financial success, with fair rates, the others will be built by business men, and the whole chain be one of successive links between here and Panama, and thence toward South America—the entire system accomplished by the same type of New England men which successfully created a coast marine commerce and then made a network of land transportation through the country. The time has come, now that the West as well as the East has a congested population and traffic, to look over sea; the moment has arrived for co-operation between land and sea transportation.



TWENTY-TWO TON LIFT BRIDGE PARTLY OPEN. ONE MINUTE REQUIRED TO LIFT.

EASTERN END OF CANAL, SHOWING 3,000 FEET BREAKWATER CONTAINING 400,000 TONS OF GRANITE.

THREE MILES OF COMPLETED SECTION OF CANAL, LOOKING EAST FROM BOURNDALE, MASS.

BUZZARDS BAY, MASS.

JOINING THE WATERS OF BUZZARDS BAY AND MASSACHUSETTS BAY THROUGH CAPE COD CANAL, APRIL 21, 1914.

August Belmont, President of the Company and William B. Parsons, Chief Engineer are the Central Figures About to Shake Hands. Captain Miller is third from Left, Holding Spade.

The general public does not appreciate the magnitude of tonnage and of passenger traffic—the latter increasing yearly as the sons of Massachusetts living in the West seek the East during the summer months. I doubt if many of our legislators understand, as an example, that the yearly tonnage around Cape Cod is as great as that which goes through the Suez Canal, and nearly twice what the Government expects at Panama. Twenty-five millions of tons pass through Vinyard Sound per annum, whereas not over fifteen millions will go through the Isthmian Canal. The eleven million tons of coal, and the large lumber. iron, ice and plaster traffic, are daily subject to the storms and fog off Pollock Rip. With the canal finished, they will pass through a region of fifty per cent less fog, save seventy miles and be free from the southwestern gales and the shifting sands of the present route.

Mr. Belmont and his associates have taken all the risk in building the new eight-mile channel. They are convinced that it will pay, as any one who understands the subject can see when it is said that the Cape Cod Canal will cost only twelve million dollars, and that economy as well as humanity demand the safer and shorter route which for nearly three hundred years has been advocated by Massachusetts men, and by Government officers as a military necessity. You railroad men also know what a help water transportation has been on the Great Lakes to the railways.

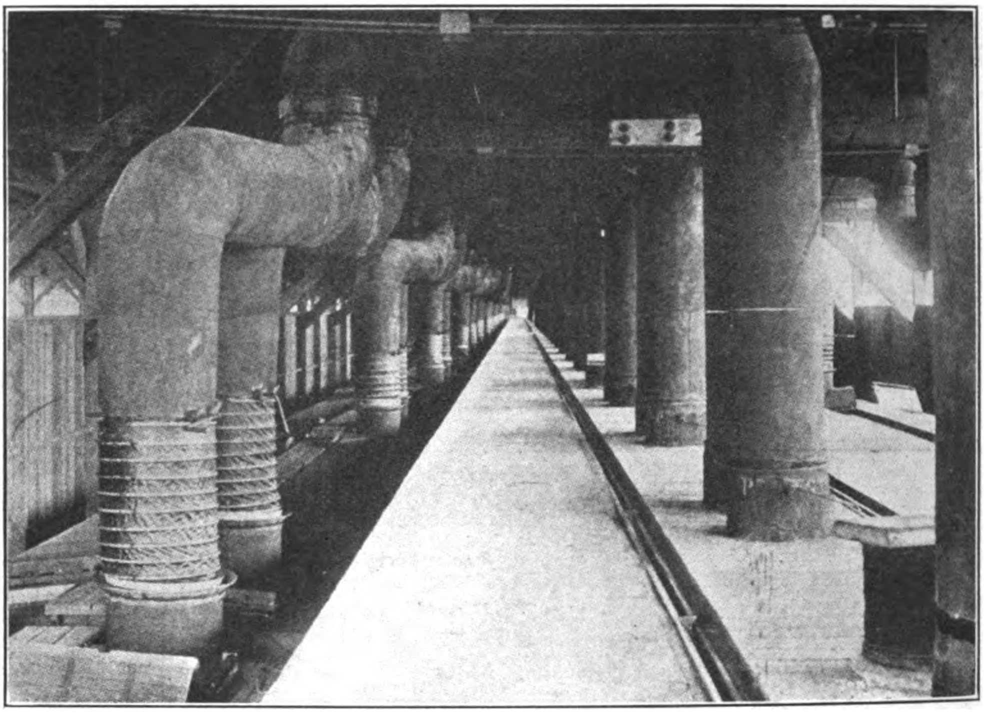
The canal is to-day completed to its full depth of twenty-five feet at low water, except for about three-quarters of a mile, and in that three-fourths of a mile there is twenty feet. Engineers will understand that whatever current may exist there at present will be considerably diminished when an even depth exists.

Some criticism has been made regarding the present rates. They are tentative, and you transportation men will realize that it is easier to change them in the future than to start with a low rate and maintain a higher one afterwards. We fully realize the fact that we have competition through the preesnt Cape Cod route, and that, after experience and consultation with our future patrons, it is our intention to be perfectly fair both to the public and to the controlling fact that there should be a just receipt on the money expended in constructing this great aid to navigation.

The California Pre-Cooling Plant of the Santa Fee System

NOTE: The following extracts are taken from an article which appeared in a recent issue of the *Santa Fe Magazine*. They show the unmistakable economy procured through the pre-cooling of citrus fruits for shipment from Pacific Coast territory to Eastern markets. The advantages outlined, are so pronounced as to make the system described of interest to other railroads having problems of a similar character to contend with.

THE element of time involved in the operation of pre-cooling being one of prime importance in accelerating the movement and availability of refrigerator cars and equipment, furnishes a factor that fits exactly with the requirements of quick and efficient arrest of deterioration and decay in the fruit or other perishable products handled. The concrete advantages of pre-cooling may be summarized as follows: Quick reduction of temperature to a safe point for transportation purposes; elimination of decay and deterioration; reduction of the number of stops and switches for re-icing in transit; shortening of time schedules between producer and market;



Twenty-two-inch Air Pipes, Connected to Bunkers of String of Refrigerator Cars, Whose Tops Are Seen to Lower Left.

avoidance of rehandling to and from storage, and extension of the market by the lengthened radius of safe shipment.

Granting the desirability, from the standpoint of both shipper and carrier, of securing these advantages above enumerated, we are brought to the consideration of adequate pre-cooling equipment, its cost and efficiency.

The combined ice-making and pre-cooling plant of the Santa Fe is located in the center of the citrus fruit district, at San Bernardino, Cal., and has been in continuous operation since its erection in 1910. "Pick-up" trains are operated throughout the entire San Bernardino Valley, are taken to the pre-cooling station as fast as loaded, and, after a delay of about four hours, proceed to their Eastern destinations, only occasional subsequent icing being needed en route. The plant was designed and constructed under the direct supervision of C. M. Gay, of Los Angeles, and the pre-cooling department was constructed under his patents, with the advantages of careful engineering tests and data derived from his operation of the Santa Fe experimental station, where only one car at a time was treated. The early experiments conducted by Mr. Gay proved conclusively many engineering facts in regard to the condition of refrigerator cars and equipment, upon which were based inventions and devices peculiar to the system finally adopted.

One fact stood out prominently—that all refrigerator cars were far from being air tight. Upon testing the cars after closing them as tightly as possible with an air pressure equivalent to half an inch, water gauge, they showed a loss of air from unseen openings of from eight hundred to two thousand feet per minute, and an equivalent vacuum within the car produced practically the esame result in the amount of air drawn in from the outside. Consequently, in order to perform the function of pre-cooling in an efficient manner and without great loss of refrigerating capacity, it was highly necessary that exactly as much air be withdrawn from the car as was being forced into it in the process of cold air circulation, and that the air circulating system must be so balanced that the point of equalization between the pressure coming from the main pressure air ducts and the suction established in the main return ducts should occur as nearly as possible in the center of the car. This preliminary explanation is given in order to afford a better understanding of the following description and the illustrations accompanying it.

The main building, comprising the power plant, tankroom, day storage and winter storage, is 511 feet 6 inches long by 132 feet wide. Connected to the winter storage, the pre-cooler chamber and the icing dock extend for a distance of 737 feet 6 inches, the icing dock proper being 693 feet long. This gives a full length of 1,249 feet for the plant, or approximately one-fourth of a mile. The structure is entirely of reinforced concrete, with interior partitions and tunnels of the same material. The building may be considered as divided into two portions, one devoted to ice manufacture, the other to pre-cooling. A reinforced concrete reservoir has been built, partially underground, thirty feet away from the powerhouse end. It is eighty feet square by ten feet deep and is used in connection with an ammonia condensing system of the two-coil double-pipe type, which is placed over the front section of the basin coincident with the plant. Adjoining this a pumphouse has been erected supplying water for the ammonia condensing system, consisting of two circulating pumps (one steam and the other electrically driven). There is a transformer station on a line with the pumphouse, and a crude oil tank, 20 by 30 by 10 feet, has been constructed similar to the water reservoir and parallel to the boiler-room.

Water for the system, including ice manufacture, is obtained from an artesian well, which is connected to the reservoir by a fourteen-inch steel pipe line. This is at the surface of the ground at the well end, and enters a measuring weir at the basin end, and enters four inches below the edge of the reservoir, giving a gradient of but one per cent. The flow from this well furnishes a supply of 500 gallons a minute, the normal flow being increased to this extent by an air lift, for which purpose a four-inch air line is placed in the same trench with the water line. The air compressors for this system are located in the boiler-room.

The ice manufacturing plant installation comprises three 350-horsepower Sterling boilers, set two in a battery and one single. These furnish steam to two 24 by 24-inch cross-compound Vilter Corliss engines, each direct connected to one 300-ton, 17 by 34-inch duplex, double-acting Vilter refrigerating machine. Adjacent to the engine room is a 36 by 24-foot fore-cooler tank, filters and ammonia receivers, the latter being placed under the filtering apparatus. The tank chamber is 116 feet 6 inches long, and extends across the full width of the building, being 21 feet high in the ceiling, with the floor line below grade the distance noted. The floor is of concrete, covered with two-inch corkboard over which there is a finish of 1½ inches of asphalt. Three 75-ton ice-making tanks are here installed, giving a total capacity of 225 tons. The cans used are of the regulation size, 11 by 22 by 44 inches, forming 300-pound blocks, and are handled three at a time by electrically driven traveling cranes. One 300-ton refrigerating tank is used for the pre-cooling system and is equipped with a Vilter flooded ammonia system of brine coils, with an accumulator.

The day storage-room is supplied with five Stevenson recording double ice chutes, a Stevenson refrigerator door, and the usual storage plant auxiliaries. It has a daily capacity of 900 tons of ice, when blocks of 300 pounds each are placed on end in one tier. The winter storage is divided into four compartments by six-inch concrete partitions, giving a storage capacity of about 7,000 tons for each section. Each room in the winter storage is provided with an endless chain ice elevator for storing, and has an iron ladder for access. Adjacent to the wall separating the tank-room and the day storage, and below the floor of the latter is a 49 by 33 by 11-foot brine chamber which is shown in an accompanying drawing. This compartment contains a 200-ton two-coil double-pipe brine cooler and three electrically driven circulating pumps. The latter are interchangeable, two being used for the storage plant or two for the pre-cooling system as the conditions necessitate; by this arrangement it was possible to omit a fourth pumping unit.

A concrete tunnel eight feet wide leading from this cooling chamber extends through both storage rooms. At the end of the winter storage the tunnel becomes a double-deck structure, the added section being of like size and construction as the lower duct. This lower tunnel is used for the brine mains to the winter storage, and to the pre-cooler coil chamber; the upper portion gives access to the winter storage and carries an endless-chain ice conveyor which leads from and through the day storage. The entire storage plant, including the brine chamber, is insulated with 1½-inch double Nonpareil corkboard, with an asphalt finish of 1½ inches thick on the floors. The roof is insulated with Linofelt and air spaces. Neither room has any outside opening, all ice being handled through the day chamber and the central tunnel in the winter storage-room.

Connected by concrete tunnels, the pre-cooler coil chamber adjoins the winter storage. It is 44 feet 6 inches long by 48 feet wide and is insulated with 3-inch corkboard. The installation consists of a brine coil of 2-inch galvanized pipe, supported by 4-inch channel uprights and small angle brackets riveted thereto. Eight double-inlet Cirocco fans, each about 10 feet in diameter, are arranged in two banks of four each. A set of four fans, two upper and two lower one each side, is driven by an 85-horsepower motor. One bank is used for blowing, while the other is for exhausting, each function being capable of execution by either set without reversing the direction of rotation. A horizontal concrete baffle, literally a floor, is placed between the two banks.

Leading from the pre-cooler chamber, two longitudinal concrete tunnels or air ducts extend to

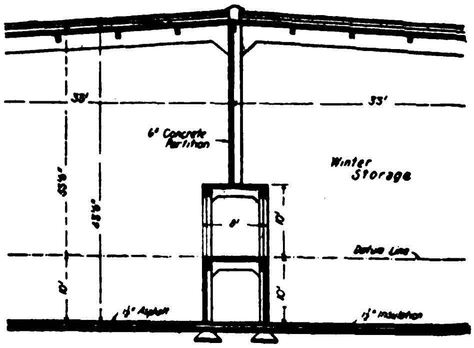
SECTION THROUGH PRECOOLER AIR DUCT



SECTION THROUGH WINTER STORAGE

form the main support of the car-icing dock. These are 7 feet 6 inches and 9 feet 6 inches high, respectively, and 10 feet 4 inches wide; both are of the same length, continuing the full length (93 feet) of the icing dock. The lower tunnel is the pressure duct, and the upper the vacuum duct, both being internally insulated with 3-inch corkboard. Refrigerating coils of 1¼-inch galvanized iron brine pipe are arranged on both sides of either duct, a total length of about 50,000 feet being required. Connecting to these sections by liquid sealed revolving joints, No. 18 galvanized iron pipes 22 inches internal diameter serve as laterals to couple the system to the refrigerator cars.

Purchasing electric current at high voltage from a central station, and stepping down to a voltage suitable for operation, the electric system offers no particular departure from ordinary practice; that is, the electrical energy is obtained at 10,000 volts and reduced to 440 volts for motor operation, and again to 110 volts for a three-wire lighting system. The alternation of steam driven and electrically driven auxiliary machinery, as previously indicated, permits of a continuance of operation should trouble occur at the central station.

The plant has a maximum pre-cooling capacity of 32 cars, 16 on either side of the icing dock, in every four hours, or approximately 150 cars every 24 hours. The brine is taken from the 300-ton brine tank, by the circulating pumps in the brine chamber beneath the day storage, sent through its refrigerating circuit and returned to be cooled by the brine coils in the same compartment. By this refrigeration of the main ducts the circulating air is kept in a similar state throughout its entire movement except when passing through the lateral connections to and from the cars. A large automatic equalizing valve connecting the pressure and vacuum ducts is placed near the terminals of the tunnels. By regulation of this valve the pressure of the air delivered to the cars and the suction at which it is withdrawn are positively governed. The opening of this valve forms a by-pass whenever the differential pressure becomes excessive, thus permitting the air to circulate through the main ducts and main cooling chamber even when no connections are made for pre-cooling.

An automatic intake is located at the extreme outer end of the vacuum or low pressure duct for the replacement of air which may be lost from the system by blowing the warm air from the cars. This is regulated to open when the vacuum falls below the differential pressure at which the equalizing valve is adjusted. The fresh air so taken into the system travels the full length of the suction duct, through the pre-cooler coil chamber, and is then delivered to the high pressure duct to be distributed through the cars. This insures the proper cooling of all air brought into the system from outside sources during the operation.

Referring to the fan installation, the upper bank is used for exhaust from the low pressure duct, delivering the air to the pre-cooler coil chamber and thence over the brine coils. The other set draws the air from the coil chamber and discharges into the lower or main pressure duct for circulation through the system. The total air so handled is about 260,000 cubic feet per minute. The lower duct is held at a pressure corresponding to from one- half to three-quarters of an inch of water above atmosphere, and the upper at a vacuum of one-half to three-quarters of an inch of water. Accordingly the air is supplied to the former at a temperature of from 8 to 10 degrees, and is returned through the latter at a temperature varying from 20 to 24 degrees.

The fundamental principle of the Gay system is to secure a balanced circuit with the pressure above atmosphere in the pressure duct, practically equivalent at all times to the vacuum below atmosphere in the return on the suction duct. By this method a balanced differential air pressure directly at the ducts is obtained without the overcoming of any frictional resistance in the coil chamber. The point of equalization of the air current is thus rendered practically in the center of the refrigerator car whenever such connections may be made. Tests at the plant show that the differential pressures are so equally balanced during pre-cooling as to allow the opening of the refrigerator doors, in the center of each side of the car, without any apparent loss of air to the outside, or the bringing in of any warm air, although a current of from 6,000 to 8,000 cubic feet per minute of cold air is passing through the cars.

Valves fitted to each lateral pipe, opening into both the pressure and the vacuum ducts as noted, secure the effect of cross connection and reversal of current, without any interchange of the laterals. By employing the liquid-sealed revolving joints, universal horizontal adjustment is obtained for connecting the laterals to the refrigerator car openings. In this manner the union can be made to an entire train without uncoupling or spotting of cars and regardless of their various lengths. The closing connection between the lateral air pipes and the cars is accomplished by a bellows spring and scissors-lever joint, comprised of leather and iron rings, operated by a crank. This preserves the entire area of the pipe under any adjustment and makes the connection airtight almost instantly. The pipes themselves are absolutely airtight, being externally insulated with two layers of three-quarter-inch felt suitably covered. By means of the universal joints they swing free of the car track when disconnected. No telescope connections are employed in this system and no internal valves, the valves used being visible for constant inspection.

In practice the cars are connected as shown. A funnel is placed over the bunker opening and the pressure air duct is first connected to the car for about twenty seconds. The cold air rushing in quickly displaces the warm air and vapors which are allowed to escape through the ice-bunker trap door at the opposite end. The lateral from the suction duct is then joined to the ice-bunker at this end of the car and circulation is established. During the cooler seasons of the year both connections are made simultaneously. The differential pressures, of course, control the speed with which the air passes; the violence of the current permeates to the center of every package, which is an essential consideration in proper pre-cooling.

The total amount of refrigeration consumed by a car of fruit averages about three tons, depending upon the initial temperature of the fruit, which, varying with the season of the year, may cause this amount to become as low as one and one-half tons or as high as four tons of refrigeration. The amount of air circulating through each car in a period of four hours approximates one and one-half million cubic feet. When the plant is running at maximum capacity the amount of air circulated through each car per minute is about 8,000 cubic feet, with an average loss of not exceeding 5 per cent. The cars are cooled to about 40 to 45 degrees Fahrenheit. For icing the cars, upon the completion of pre-cooling, or for such cars as are not pre-cooled, the ice is handled by the endless-chain conveyor, running through the day and winter storage. Here it may be diverted or carried on to the dock, the conveyor traversing the full length on both sides and making the ice accessible for immediate loading.

The plant is provided with facilities for metering all the brine used in pre-cooling, and in cooling the ice-storage chambers, also with thermometers giving the temperatures at all such places. Barometric columns are installed in the main air ducts and laterals, showing the pressure at which the air is circulated and returned. To afford a complete refrigerating record on every car handled the velocity of air in both feed and return laterals is measured. A brine system of refrigeration has its advantages in pre-cooling work. During the period of changing trains and other intermissions the plant is given an opportunity to store up cold brine, placing it in position to properly handle the large refrigerating demands made when a full load is incurred. The original charge of ammonia at the Santa Fe plant was about 13,000 pounds, and during its period of operation this has been added to but slightly.

The plant represents an investment of about $900,000.

The time consumed at this plant in connecting up two strings of fifteen cars each to the 22-inch air ducts and establishing complete circulation with four operatives employed in the work of making connections is only ten minutes, and the carrying temperatures are reached in the period of four hours or less, as compared with twenty-four to forty hours under ordinary cold storage conditions.

During the month of April, 1912, the San Bernardino plant pre-cooled from 50 to 150 cars of fruit a day to an average carrying temperature of 45 degrees, and in no instance was more than four hours required to cool a full setting of 30 cars to such temperature, and at average measured refrigeration of less than three tons per car so pre-cooled, making the actual cost of pre-cooling much less than the cost of handling alone under storage conditions.

The Supply Man and the Railroads

By E. H. Walker, Vice-President, Standard Coupler Company.

Note: The following paragraphs are taken from an address delivered before the September meeting of the Richmond Railroad Club.

TO-DAY the railroad man recognizes the supply man as worthy of being taken into the family. A friendliness exists, like the colored woman, who replied when asked how her new husband treated her: "Why, that man treats me more like a friend, than a relative." He is now consulted when family matters are under discussion. He is called upon for help, when the family exchequer runs low. If new cars are needed, the car builders and car specialty men are invited to talk about them and to suggest and submit designs. If locomotives, machine shops, rails, signals, water tanks, waste, or tin cups are to be bought, the men interested in their manufacture and sale are called into conference. The railroad man to-day welcomes into the family conference room the well-informed supply man, because he gives valuable and highly specialized information, compiled by engineers who have devoted their lives to individual lines or specialties.

Now, as a result of being invited into the family, or, perhaps, one of the reasons he was invited in, the supply man no longer closes a deal with the passing of the money. He not only studies the conditions under which his device must operate before he tries to sell it, and spends time and money to bring it to as near operating perfection as is possible, but he is just as anxious to have his device work successfully after its sale; in other words, the supply man to-day is selling service, and he obligates himself to see that service performed. He is now a recognized member of the family, and his interest in a railroad grows as the increasing quantity of his goods go into service. He is constantly watching the increasing train tonnage and tons per loaded car, the reduction of bad orders, the lengthening of mileage before back shop work must be done and watching with interest and pride equal to that of the railroad operating official, because he feels he had some part in that greater efficiency. He also studies railroad officials, not only before they buy his goods, but just as particularly afterwards, and he compares their efficiency, with officials on other lines, particularly as to results obtained with his goods. You shop men know how one man will get twice as much work out of a tool as will his bench mate. This difference exists all through the ranks, and the supply man of to-day is earnestly working to get the service of his device on every railroad up to the same high standard. Many concerns keep men on the road constantly, instructing the operatives how to take better care of their goods and how to get better and longer service from them.

Now, as to prices. Generally speaking, the railroads to-day purchase their necessities cheaper than does any other buyer. This close buying is the result (1st) of better harmony between the departments consuming the materials and the purchasing department; (2d) of greater efficiency in the purchasing department, and by this I mean, knowledge of the markets, of the origin and manufacture of railroad materials, of the use or purpose of the purchased articles and what service they should perform; (3d) and not the least effective, is the better understanding and mutual confidence that has grown up between these two relations—the purchaser and the manufacturer.

There is another thought in connection with this Railroad Family and the better atmosphere therein: We have all heard, or heard of, poor relations "roasting" their richer relatives, especially if the treatment accorded them was not to their liking. I am inclined to think that when the supply man was given the cold cuts instead of the warm welcome he thought was his due, he did not hesitate to do some "knocking" himself when the subject of railroads came up in his presence. The railroad man sees the supply man generally only in the position of asking for business, a suppliant for favor. The other side of the picture is that the supply man in his own community is a dignified personage. He employs labor, he pays wages, buys materials, and spends money for freight and passenger fares. He belongs to organizations of public and private character, and is a potential factor in the forming of public sentiment.

A good deal of jocularity has been indulged in because of our ability to talk. We have to talk, to sell things. I never yet met a deaf and dumb salesman, and I can imagine what some of you would think if I should come into your office and pull off a moving picture stunt. The supply man has had to talk and is still talking, but he is broadening the scope of his conversational powers. Wherever you go to-day, you hear him; in the hotel lobbies, smoking rooms of sleepers, club rooms, in his private or public life, in his organizations and even in church, boosting for the Railroad Family. This is partly selfish, because he knows that he does not prosper if you do not, but let me tell you, it is also largely sentimental, because he is now recognized as not an inconsequential part of the family. And the sentimental flavors the selfish until the boost is not only invigorating to the boostee, but the flavor is appetizing in the mouth of the booster.

We must not think, however, that all our family troubles are over—far from it. Family jars are liable to occur, and some families are in a jar all the time. You remember the story of the servant girl who gave her mistress the usual week's notice of quitting. When reproached for leaving, and asked if she had not always been treated like one of the family, she replied: "Yessum, that's just it. You've treated me just like a member of the family, and I've stood it as long as I could."

There will always be differences of opinion between individual members of the family, but as long as these are honest differences, and as long as healthy family relations are maintained, the supply man will be found lined up, ready to go to the front, when his money, brains or conversation are needed for the family—the transportation interests of this country.

We had a common ancestor, we have common interests. Why shouldn't we stand together and work together, with mutual respect, and with family ties growing closer each year?

Report on Recommendations of Latin-American Trade Committee

Note: The committee appointed by the Honorable W. C. Redfield, Secretary of Commerce of the United States, representing practically all branches of trade and commerce, and of which James A. Farrell is chairman, has made its report on South American trade conditions and how increased exports to those countries may best be accomplished by the merchants of the United States. After dealing with present South American trade conditions, the character and value of the present importation into those countries, as well as the part played by the United States in this trade, the report deals with the possibilities of the future. The following paragraphs will prove of particular interest to railway traffic officials as coming from an authoritative source after a comprehensive investigation of the whole situation.

(1) Because of the war the Latin-American countries are confronted by the necessity:
  (a) of marketing their products despite the shrinkage of world purchasing power.
  (b) of obtaining funds to move crops and to continue indispensable industrial and agricultural development normally financed by Europe.
(2) The United States is confronted:
  (a) By the necessity of holding its normal export trade with Latin-America.
  (b) By the possibility of increasing that trade by filling Latin-American needs for merchandise hitherto purchased in Europe, which Europe cannot now supply.

The solution of these problems depends upon:

(1) Production.
(2) Transportation—Shipping and Insurance.
(3) Financing:
  (a) of Production.
  (b) of Transportation.
  (c) of Settlements.

Production in the United States can be maintained if there be a sufficient market at home and abroad for American goods. Production in South America may continue but cannot be further developed unless financial assistance be obtained.

At the present time steamships are available and sailing regularly from this country to the principal ports of Latin-America and from those ports to the United States. Many of these vessels are unable to obtain full cargoes. Although only a limited number are under the United States flag the above will clearly indicate to exporters, importers and manufacturers that they need not hold back from entering the field on this account.

Before trade can resume its normal course, the exchange problem must be solved, either by the restoration of old, or by establishment of new credit facilities.

New Credit Machinery Needed.

Old methods may no longer be serviceable in the situation which will result from the readjustment following the war. It should now be possible indeed, in the mutual interest of the Latin-American Republics and ourselves, to create new credit machinery to perform the functions of the old, and which will at the same time rid us, at least partially, of a dependence upon the London credits and European financial markets which, though essential in the past, has proved to be seriously embarrassing.

Deprived of the European loans with which their resources were being developed, Latin-American countries are now undergoing a serious curtailment of industry and development. The consequences in many instances will be serious, not only to these countries themselves but also to the countries which expected to supply the materials.

It has been increasingly the practice of European bankers to stipulate the use of European material in the projects which they financed. Latin-America is now turning to the United States for funds. This country is hardly in a position to undertake considerable investments at the present time, *but industries with an already considerable trade at stake may well consider the necessity of protecting that trade by obtaining for their customers some relief from the present stringency. Such investments, if judicially made, would yield an ultimate fair return and meanwhile provide a market for American materials which cannot now be sold.*

The question of creating a market for Latin-American securities in the United States, therefore, is highly important. The development of our trade with those countries is largely dependent on its satisfactory solution.

Establishment of Commercial Credits Most Important.

Unless the restriction of commercial credits be remedied, however, we will not only be unable to extend our trade but we will lose a considerable portion of that which we already have.

The present effort to secure co-operation of American bankers in massing a gold fund to satisfy our obligations abroad by promising to cause London exchange again to approach normal, will lessen to the American importer the expense of liquidating in London his South American indebtedness. It will nevertheless give effect to the old alienation of the selling power we *should* derive from purchases of South American products. Liquidation of South American indebtedness in London will pay for British exports to Latin-America, at a time when American merchandise, intimidated by moratoria, remains congested on our docks. Our available money will serve Great Britain's effort to capture South American markets vacated, perforce, by Germany.

Whenever there is a great disturbance of the world's finances, American exporters and importers in South American trade are injured, because of their dependence on London. *This has happened four times in twenty-five years.*

So long as South America must meet interest settlements in London by shipment of goods to the United States, under the old three-cornered system, our South American trade must, to a certain degree, depend upon London exchange.

But in view of the facts above mentioned, it has seemed to your committee that the need for independence, emphasized by the present situation, should be recognized. We feel that an attempt should now be made to evolve some plan whereby we might take advantage of our large direct trade with Latin-America to make a market for bills drawn in dollars, and establish a direct exchange, not with the view of eliminating sterling credits now or later, but in order to provide an exchange channel which will supplement, offset or compete with London, and be available in an emergency when London exchange is disorganized.

The maintenance of exchange relations depends on a credit machinery and reciprocal balances. This machinery will partially be provided under the Federal Reserve Act, which permits American banks to open branches abroad and permits a rediscount in this country of commercial paper, based upon shipments of commodities in foreign trade. These steps, however, have not yet been effected, and your committee appreciating that the installation of this machinery may require considerable time, has considered means for temporary relief.

Co-operative Exchange as Emergency Measure.

A plan for the establishment of a Merchants' "Co-operative Exchange," or clearing house for Latin-American trade, has been proposed. This, it has been suggested, would enable importers and exporters of goods to and from Latin-America to watch credits, balances to be remitted on certain definite settling dates. The chief argument for such an institution is that it would bring together exporters and importers among whom there is now no cohesion. Both know their cash requirements each month. If the exporters require say $5,000,000 to pay for their October shipments to Brazil and the importers a like amount to pay for their imports from Brazil, such an exchange might be able easily to liquidate transactions in New York.

The plan, however, is open to serious objection for the following reasons:

(1) The necessity and difficulty of securing the co-operation of a sufficient number of importers and exporters.

(2) The necessity and difficulty of standardizing credits.

(3) The difficulty of reaching an agreement as to the rate of exchange between South American currency and United States dollars.

(4) The difficulty due to the seasonal variations of shipments of South American produce and the consequent fluctuation in the demand for balances in New York or South America.

(5) The disorganized financial situation in South America, which increases the risk in securing settlements in the South American republics.

(6) The necessity of creating and maintaining an expert and, therefore, expensive organization.

The difficulty as regards South America, however, would still remain, for it would be impossible within any reasonable time to organize in the principal cities of South America sufficiently extensive co-operative associations of importers and exporters of American products.

Standardization of South American credits, therefore, could only be secured by the guarantee of American shippers or importers, or by the guarantee of the South American governments themselves.

Your committee, therefore, after careful consideration, feels that the suggested "co-operative exchange" would not be practical, although a powerful banking group or large banking institution willing to assist in maintaining and developing our Latin-American trade might be able to secure and render mutually beneficial the organized co-operation of exporters and importers in matching credits.

RECOMMENDATIONS.

Your committee, however, believes that the extension of credits might be facilitated and some relief afforded, pending the establishment of the Federal Reserve Banks if, in addition to permitting national banks which have signified their intention to enter the Reserve Associations, to accept commercial paper, action be taken by the Federal Reserve Board to make immediately effective the rediscount provision of the new banking system thus assuring early establishment of a discount market.

Your committee, while appreciating the necessity of conserving the banking resources of this country for the protection of our domestic situation, nevertheless believes that the *cessation or curtailment of our trade with Latin-America will in itself be highly injurious to American industry,* just as we believe that *the extension of this trade would make for the prosperity of the country at large,* as well as of those directly interested. We therefore hope that American banking institutions may be induced to meet the present emergency, not by tentative and inadequate measures, but by extending accommodation sufficient at least to assure the maintenance of our already established trade.

EXTENSION OF TRADE.

The question of extending American commerce with Latin-America depends primarily, as does the problem of maintaining our trade, upon the establishment of commercial credits, upon our ability to finance Latin-American enterprise, purchase the products of its soil and industries and upon the perfection of our selling machinery.

Your committee has not attempted to formulate suggestions as to the manner in which the individual manufacturer should proceed to establish a market for his products in South America. Nor does it here dwell upon the importance of adaptation of the product to the needs of the market or proper packing. Too high praise can not be given the Government, particularly the Department of Commerce under the Hon. W. C. Redfield, for its effective propaganda on these essential points and for its efforts adequately to assist extension of our foreign trade.

CAUTION NOW ADVISABLE.

Your committee feels, however, that merchants and manufacturers now contemplating an entry into the Latin-American field should be careful to avail themselves of the easily accessible information concerning these markets. It is suggested that they should, at the outset, remember that the cost of maintaining individual representatives would probably be too great for any one of them to bear themselves. It is therefore suggested that associations consisting of the smaller firms or corporations engaged in kindred lines of production might be formed, and that either one or more representatives should be sent to South America to look after the interests of such associations, thereby bringing the cost of representation within a reasonable limit.

It has been suggested that American manufacturers should combine to send to South America trade exhibits, showing the various articles which they have for sale. Your committee, however, is not inclined to feel that such measures would be productive of any permanent results. It is suggested instead that manufacturers and dealers desiring to place their products in Latin-America, and who, for any reason, prefer not to send their own representatives there could establish connections with export houses already doing business in those countries and maintaining large branch offices in the principal South American cities fully equipped with efficient sales organizations or who have established connections, and in certain lines of goods—foodstuffs, notions, and miscellaneous articles—join in establishing what might be called for want of a better name an "American Store," in certain of the most important cities.

Ventures of this sort, however, require considerable capital and experienced men, and for the sake of the ultimate development of mutually beneficial commercial relations with Latin-America it is believed that our merchants and manufacturers should not attempt to instal their own establishments in Latin-America unless they are prepared to meet initial losses and disappointments before realizing even moderate profits in what must necessarily be a developing, rather than a ready made business.

Your committee begs, therefore, to summarize the results of the investigations and to state its belief that the present disorganization of the trade of the United States with Latin-America may best be remedied and placed on a permanently satisfactory basis as follows:

1. The establishment of a dollar exchange.
    (a) By the ultimate creation of a discount market.
    (b) Pending the establishment of a discount market, by the extension of adequate accommodation by banking institutions and the establishment of reciprocal balances in the United States and in Latin-America for financing Latin-American trade.
2. Perfection of our selling machinery.
    (a) By furnishing additional support to commission houses already familiar with Latin-American business.
    (b) By forming associations of merchants and manufacturers to be jointly represented in Latin-America.
    (c) By obtaining information as to the possibilities of developing retail stores in large Latin-American cities.

Financial

The Outlook.

GENERAL conditions have undergone considerable improvement since a month ago. The election showed a strong desire on the part of the people for a return to more conservative methods in legislative activities, and it is felt that this warning will be heeded by the present administration, and that the next two years will witness a consistent effort to again restore general prosperity. In fact, the President of the United States in a letter written on November 17th, to Secretary McAdoo of the Treasury Department, practically asserts that the democratic program of remedial legislation has been completed and that the future can now be devoted to the upbuilding of national prosperity on a sound basis. The future can alone decide the accuracy of the President's predictions, but the tone of his letter, which was enthusiastically optimistic, will undoubtedly have a beneficial effect on the minds of the general public.

Railway earnings still continue unsatisfactory, but there are indications of a distinct revival in certain branches of business, which will be felt later in increased tonnage. This is particularly true of the steel trade, and recent orders placed in the Pittsburgh, as well as in other steel districts, show a return to practically normal conditions, with indications of boom times within a comparatively short time. Furnaces are being blown in, idle men are obtaining work and new orders are being received in satisfactory volume.

The whole country is, of course, awaiting the Interstate Commerce Commission's decision in the Eastern advance rate case. A favorable decision means the restoration of confidence both at home and abroad in American railway securities and would undoubtedly result, in a short time, in enabling the carriers to again adopt a progressive policy in the operation of their lines and actively engage in the rehabilitation of their properties. This stimulation in railway purchases, which would thus be accomplished, would rapidly be felt by every business in the country and would do more to restore prosperity than any other single influence. It would appear incredible, under the circumstances, that the Commission could refuse the railways the relief which is so urgently needed, and which was so conclusively proved to be necessary at the recent re-hearing. The business men of the country are almost unanimous in their desire for the Commission to grant the increase, and it is confidently expected that favorable action will be taken.

Business 'is picking up. —Mobile Register.

Revenues and Expenses of Steam Roads for August.

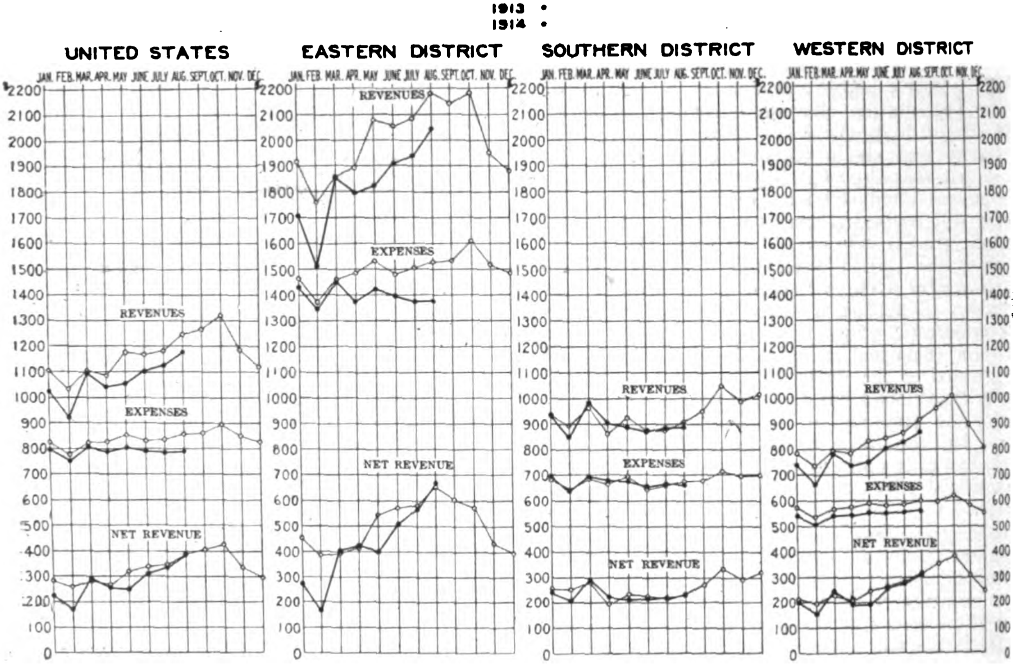
THE Bureau of Railway Economics has issued its Bulletin No. 68, which contains a statistical summary of the revenues and expenses of steam roads in the United States for the month of August, 1914.

The situation, in brief, reveals the fact that railway operating income for August, reduced to a per mile of line basis and compared with that for August, 1913, shows a decrease of $3. or 0.8 per cent, while operating income per mile for August, 1913, showed a decrease of 13.6 per cent from that of August 1912. Total operating revenues per mile for August decreased 5.6 per cent as compared with August, 1913, operating expenses per mile decreased 7.8 per cent, and net operating revenue per mile decreased 0.6 per cent.

Railways operating 227,184 miles of line are covered by this summary, or about ninety per cent of all steam railway mileage in the United States. Their operating revenues for the month of August, 1914, amounted to $256,928,165. This

MONTHLY REVENUES AND EXPENSES PER MILE OF LINE

ROADS HAVING ANNUAL OPERATING REVENUES ABOVE $1 000 000



The points on the vertical lines are of significance only in showing the condition for the particular month. The lines connecting the points assist in tracing the change from month to month but do not indicate the trend during the month, nor are they cumulative for the period.

amount includes revenues from freight and passenger traffic, from carrying mail and express, and from miscellaneous sources connected with rail- and auxiliary operations. Compared with August, 1913, these operating revenues show a decrease of $12,496,358. Total operating revenues per mile averaged $1,175 in August, 1914, and $1,244 in August 1913, a decrease of $69, or 5.6 per cent.

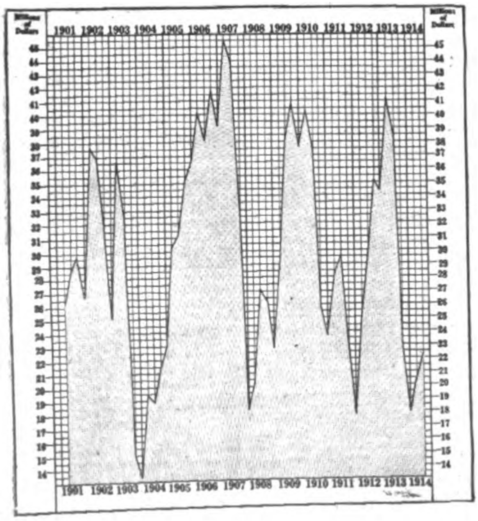
Operating expenses, which include the cost of maintaining track and equipment, operating trains, securing traffic, and of administration, amounted to $179,163,880. This was $12,989,650 less than for August, 1913. These operating expenses per mile of line averaged $789 in August, 1914, and $856 in August, 1913, a decrease of $67 per mile, or 7.8 per cent.

Net operating revenue, that is, total operating revenues of rail and auxiliary operations less operating expenses, amounted to $87,764,285, which was $493,292 more than for August, 1913, but that this increase is due to increase in mileage is shown by the fact that net operating revenue per mile decreased. Net operating revenue per mile of line averaged $386 in August, 1914, and $388 in August, 1913, a decrease of $2 per mile, or 0.6 per cent.

Taxes for the month of August amounted to $11,288,351, or $50 per mile, an increase of 0.7 per cent over August, 1913.

Operating income, which is net revenue from rail and auxiliary operations, less taxes, averaged $336 per mile of line, and in August, 1913, $339, thus decreasing $3 or 0.8 per cent. Operating income for each mile of line for each day in August averaged $10.85 and in August, 1913, $10.95. Operating income is that proportion of their operating receipts which remains available to the railways for rentals, interest on bonds, appropriations for betterments, improvements, new construction, and for dividends.

The Steel Trust's Quarterly Earnings



Recent Railway Earnings.

INCOMPLETE returns of railway gross earnings for October made to the "Commercial and Financial Chronicle," show alarming declines in all sections of the country. Stated in brief, the United States and Canadian roads represented in this early statement and which embraces only 92,332 miles of road, show a loss in gross earnings of no less than $14,000,000 or about sixteen per cent, as compared with similar returns for the same month of 1913. In other words, gross earnings for October of the present year were $75,500,000 as compared with $90,000,000 for the tenth month of 1913. In general, all classes of roads in all sections of the country contributed to the decline. The following table shows both the increases and decreases for October as tabulated by the "Chronicle":

Principal Changes in Gross Earnings in October.

	Increases.
Chesapeake & Ohio	$136,505
Denver & Salt Lake	78,625
Detroit Toledo & Ironton	66,156
Colorado & Southern	65,019
Mineral Range	50,224
Representing 5 roads in our compilation	$396,529
	Decreases.
Canadian Pacific	$5,205,000
Louisville & Nashville	1,302,749
Southern Railway	1,271,909
Great Northern	949,406
Canadian Northern	791,800
Illinois Central	644,893
Grand Trunk	643,224
Seaboard Air Line	516,275
Mobile & Ohio	310,713
Missouri Pacific	307,000
Wabash	306,391
Buffalo Rochester & Pitts	298,057
Grand Trunk Pacific	[a]264,095
Denver & Rio Grande	199,500
St Louis Southwestern	183,000
Western Pacific	155,000
Yazoo & Miss Valley	152,338
Cinc New Orl & Tex Pac	148,242
Alabama Great Southern	127,142
Chicago & Alton	125,947
Texas & Pacific	125,662
Duluth South Shore & Atl	92,944
Missouri Kansas & Texas	82,538
Chicago Ind & Louisville	72,205
New Orl & Northeastern	66,417
Minneap St Paul & S S M	54,322
Midland Valley	39,292
Minneap & St Louis	38,712
Alabama & Vicksburg	35,337
Georgia Southern & Fla	34,333
Vicks Shreve & Pacific	33,556
Chicago Great Western	31,415
Representing 32 roads in our compilation	$14,609,421

These returns are, of course, of a most disquieting character and losses are now reaching such proportions that railroad managers are practicing the most rigid economy in order to avert bankruptcy.

The same Journal has issued a more complete statement regarding both gross and net returns for the month of September. So rigid were the economies practiced during that month that, in spite of a loss in gross of nearly $13,000,000, net earnings showed an increase of over $700,000, as indicated in the following statement:

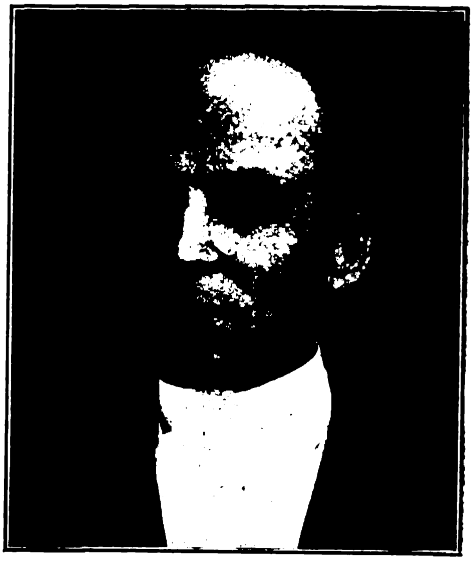
September (469 *roads*)—	1914.	1913.	*Inc.* (+) *or Dec.* (—). *Amount.*	%
Miles of road	242,386	238,698	+3,688	1.55
Gross earnings	$272,992,901	$285,850,745	—$12,857,844	4.50
Operating expenses	180,969,954	194,576,712	—13,606,758	6.99
Net Earnings	$92,022,947	$91,274,033	+$748,914	0.82

In this connection, however, it should not be forgotten that comparisons are with a diminished net of over $5,000,000 of a year ago, while the economies which have been made necessary to procure even this negative result, have proved extremely detrimental to the entire railway system as well as to the general prosperity of the country. To quote from the "Chronicle's" statement:

"Comparison is with diminished net a year ago. For September, 1913, our completed returns showed only a moderate gain in gross, namely $9,805,231, or 3.56 per cent, and this was attended by an augmentation in expenses of $14,958,298, or 8.44 per cent, causing, therefore, a loss in net of $5,153,067, or 5.26 per cent. In September, 1912, on the other hand, the gain in gross revenues was of more satisfactory extent, but the net even then failed to keep pace with the rise in gross receipts. In other words, our September statement for 1912 showed $19,891,032 increase in gross, or 7.88 per cent, but this was attended by an addition to expenses of $13,855,420, or 8.58 per cent, leaving, therefore, only $6,035,612 increase in net, or 6.64 per cent."

Eastern Railroads' Losses in July and August.

THE railroads in Eastern territory now applying for an advance of five per cent in freight rates have filed with the Interstate Commerce Commission detailed statements



Bishop John C. Kilgo of Durham, N. C.
Recently Elected to Board of Directors of the Southern Railway.

---

[a] These figures are for three weeks only.

of their operating results for the first two months of the fiscal year 1915. These figures show a loss in operating income for these two months as compared with the same months of the last fiscal year amounting to $271,190, and a loss as compared with the same months of 1913 of $9,878,000.

Total earnings are less than 1914 by nearly $15,000,000, and operating expenses have been reduced by almost precisely the same amount.

The loss in gross revenues for the two months is represented by a reduction of $9,966,000 in freight, and $4,246,000 in passenger earnings.

Railroad Securities Maturing in 1915, 1916 and 1917.

ILLUSTRATIVE of the significance of the claim of the railroads that the difficulties of securing new capital and of refunding old issues will be greatly increased as a result of the war in Europe, the Eastern railroads have filed with the Interstate Commerce Commission a statement of the aggregate amount of securities maturing during the fiscal years ending June 30, 1915, 1916 and 1917, respectively, for those railroads now asking an increase in freight rates.

These railroads alone must pay off or refund a total of $537,000,000 during the next three years.

* * * *

Of this amount, $325,000,000 are represented by short-time notes, debentures and plain bonds. Of mortgage bonds, $26,000,000 will mature; of collateral trust bonds, $62,000,000; of equipment obligations, $92,000,000; of receivers' certificates, $30,000,000.

By far the greater portion of these maturities will become due before June 30, 1915, the total amount which must be refunded by that time being $320,000,000, of which, $220,000,000 are notes, debentures and plain bonds.

Out of $537,000,000 due by all of these railroads, $303,000,000 represent obligations of the three so-called typical systems, namely, the Pennsylvania, Baltimore and Ohio, and New York Central Systems. These companies alone must pay off $174,000,000 before June 30, 1915, and of this amount, $156,000,000 is represented by short-time notes, debentures and plain bonds.

Public Service Commission Approves Long Island Railroad's Bond Issue.

THE Up-State Public Service Commission of New York has approved an issue of a million dollars of the Long Island Railroad's gold 5 per cent equipment trust obligations, Series A. The total issue will be for $1,060,000 to be sold at not less than par and accrued interest, pursuant to an arrangement with The Fidelity Trust Company and Edward P. Gest as trustee. The proceeds, plus a cash payment of $125,000 will be used in the acquisition of the following equipment:

Twelve steel P.54 passenger cars, 3 steel P.B.54 passenger and baggage combination cars, 40 steel M.P.54 motor passenger cars, 15 steel M.P.B.54 motor passenger and baggage cars, 20 steel B.40 baggage and express cars, 4 steel B.M.62 baggage and mail cars, and 3 M.P.B.M. motor passenger, baggage and mail cars.

The car trust certificates, guaranteed principal and interest by the Long Island, are to be taken up in ten annual payments of $106,000 and interest.

Operation

Car Interchange.

H. BOUTET, chief interchange inspector at Cincinnati, Ohio, recently addressed the members of the South and Southwestern Railway Club on the subject of "Interchange of Cars." After analyzing and criticising some of the methods now in vogue and showing the necessity of the closer co-operation between all employes and factors involved, Mr. Boutet gave the following description of the methods employed at Cincinnati:

"Let us take the situation at Cincinnati. The majority of interchange is made through switching lines or through two or three yards by the delivering line, the distance between some of the delivering line and receiving line yards being twenty-six miles.

"There are several methods by which inspection and interchange could be made, all of which the writer claims is within scope of M. C. B. Rules.

"First. It could be made by the receiving lines putting their inspectors in the delivering line's yard and after the cars are side carded, inspecting and marking out such cars that they want repaired, transferred or carded. Cars passing the inspectors as O. K. for service could be switched out and delivered to the receiving line.

"Second. Cars could be inspected by the delivering line's inspectors and cars that they think should be repaired or transferred and defects that they think should be cared for, should be carded and delivered to the receiving line.

"Third. The inspectors could be placed under the chief interchange inspector, cars inspected in the delivering line yards, cars that are required to be set out could be marked out, those requiring repairs could be repaired, those requiring transfer could be transferred and those requiring cards could be carded.

"Fourth. Cars could be given a safety inspection in the delivering line yard by the delivering line's inspectors to see that the cars are safe to go to the repair or transfer track of the receiving line, when they are delivered in the receiving line's yard they could be inspected by the receiving line's inspectors, cars that require repairs or transfer are set out for necessary work and the cars requiring cards could be carded.

"Now let us see the advantages and disadvantages of these different plans.

"First. It would be necessary for the lines to have twice as many inspectors or more than would be required under the other plans, as no road would agree to have a car inspected in a foreign yard and then switched and handled by a foreign road, without again being inspected when received in their yard.

"You would have the advantage of having all bad order cars set out in the delivering line yard, consequently, you would only receive good cars or only such bad cars as were made such after inspection.

"Again, it should be taken into account, that no inspector would take any responsibility if he was placed in the delivering line yard and if there was any question at all he would set the car out. His foreman would not take any great exceptions to this, for if the delivering line foreman would come to him and tell him that his inspectors were too close, the only answer he would get was that they were not any closer than your inspectors, for your inspectors are doing the same in my yard, and when you have your inspectors set out only such cars as should be set out, I will have my inspectors do the same thing. The consequence would be, if you did not have a chief interchange inspector or assistants located in each yard both day and night, your line would be blocked in twenty-four hours with cars that the receiving line's inspectors had set out for repairs or transfer, when in fact a great number of them should not have been set out, but should have been on their way to destination.

"You have delayed freight, caused extra switching and consequently, created additional expense, and also created a feeling with the shipper that you had not attempted to give him the proper service.

"Second system. It has never been found that the delivering line will inspect and card all cars that the receiving line wants carded or set out all cars that the receiving line thinks should be set out, either for transfer or repairs, nor will they card all cars for defects that the receiving line wants carded.

"This system has been tried at every large interchange point in the country and has never proved satisfactory.

"You have all of the work to do over, as you are not satisfied that the other fellow has given you all that you should have had and as you have to answer for the safety of equipment going over your line, you want to know positively that it meets all requirements and will have your own men inspect the cars as they come to you.

"Third system. This does not always prove satisfactory as the men you employ are under another man's jurisdiction and supervision and you are not always able to get results that you require, as the instructions that you require for your particular line are not always carried out in the manner you desire, as the instructions issued to inspectors are of a general nature and about on a par with what all the roads require. In this way you have your work to do over for about the same reasons as given in the second system.

"Fourth system. This has some disadvantages, but in the writer's opinion has a great many advantages over all of the other systems.

"You have the disadvantage of bad order cars to your line either for repairs or transfer, which is offset by the cars in the same condition going from your line to the other line.

"The advantages are numerous.

"You have the advantage of having your own inspectors in your own yard directly under your own supervision and you can require them to use their judgment, according to the instructions given by you in the marking out of cars for repair or transfer.

"Every car that they mark out is brought to the immediate attention of the car foreman and every car that they mark out that should not be marked out, you have the remedy which you can apply directly. The consequence is that they do not mark any cars out that you do not want marked out and in this manner save a lot of switching and confusion.

"Again, if a car should have a cotter key out or a bey bolt or other slight repairs, which the inspectors could not make in less time than they could mark the cars out, you will have them make these repairs, but if the car was in the other person's yard the inspector would make the claim that he was sent there to inspect cars and not repair them.

"The fourth manner, as described above, is the way the interchange is done at Cincinnati, as it is believed to have accomplished the best results, keeping the cars moving with as little loss of time and not setting cars out that do not require setting out, only setting out such cars that are liable to cause damage, the inspectors in the receiving line yard carding for all defects on cars that they do not wish set out.

"The assistant chief interchange inspector visiting each yard each day and carding all cars set out for repairs, combinations and heavy defects.

"This manner of carding has been in effect a little over two years and while there have been some cases where the inspectors have been wrong, where we have been compelled to give rebuttal cards to straighten the trouble, I have the first case to find where the inspector wilfully misused the cards.

"There is no set back of cars for bad condition, except through instructions of the chief interchange inspector, which consequently put the set back cars at a minimum.

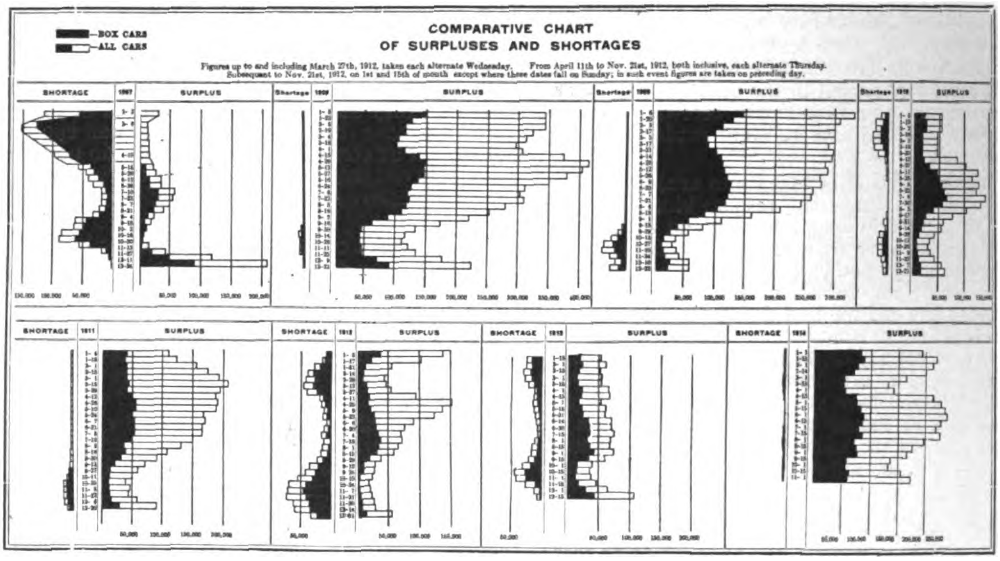
"This manner of interchange is believed by the writer to be the best system of interchange in the country to-day, as there is less friction and contentions than we have ever had with any other system that has been tried at this point, and I believe that it compares favorably with any other large interchange point in the country and it does not deviate from the principles laid down by the M. C. B. Rules."

Careful Use of Whistles and Bells.

VICE-PRESIDENT and General Manager W. R. Scott of the Southern Pacific Company, has called upon all engineers on the Pacific System to be more careful in the use of whistles and locomotive bells when passing through the limits of cities and towns, especially at night, in order not to cause annoyance to residents or to disturb the slumbers of those living along the railroad right of way.

Mr. Scott refers to the fact that the use of whistles and bells is closely regulated and called for under penalty of fine by State laws, and that the railroad, for reasons of safety in train operation, is compelled to signal to its trainmen and to warn drivers and pedestrians at crossings by these means.

Under the rules of the Southern Pacific, whenever a train has stopped beyond a certain length of time, a flagman must be sent out to protect



his train from another that might be approaching. When the engineer is ready to start again, he must call in his flagman by four blasts on his whistle. The bell must be rung when an engine is about to be moved, or when nearing a street or highway crossing at grade.

Strict adherence to these rules is necessary in order that the lives of passengers may be amply protected, and that automobile and team drivers as well as pedestrians at crossings and along the track be warned of the approach of a train.

Mr. Scott calls on engineers, while strictly maintaining all safety precautions and faithfully observing the law, not to prolong whistling or bell ringing unnecessarily.

Latest Report on Car Situation.

THE report of the American Railway Association issued on November 9th, with reference to the car situation, discloses disquieting developments. The total surplus on November 1, 1914, was 172,325 cars as compared with 154,342 on October 15, 1914 and but 38,276 on November 1, 1913. The increase of idle cars, as indicated by these figures, is not only unusually heavy for this time of the year but the total surplus is greater than it has been for the same period since the American Railway Association began the publication of these reports. The accompanying diagram presents a record of the surpluses and shortages for a period of eight years.

Prompt Movement of Passenger Trains on the Pennsylvania.

A RECORD of all passenger trains on the Pennsylvania Lines East of Pittsburgh and Erie shows that out of a total number of 412,187 trains running over the different divisions during the first six months of 1914, 371,523, or 90.1 per cent, made schedule time, while 345,653, or 84.5 per cent, arrived at their destinations on time.

The heavy storms of last winter and early spring played havoc with the time schedules of the railroads. But despite this the Pennsylvania Railroad was able to keep this large percentage of its trains running on schedule time.

The best record for the six months for trains making schedule time is held by the Cresson Division; out of a total of 6742 trains running over the Division, 6492, or 96.2 per cent, made schedule time.

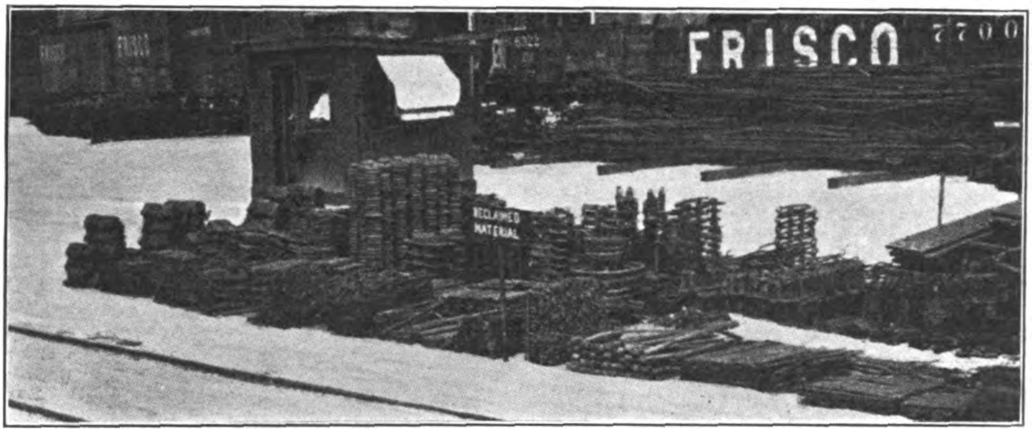
Electric trains on the West Jersey and Seashore Division have the best record for arriving at their destinations on time; 14,939 electric trains traveled over this division from January 1st to July 1st, and out of this number only 715 were late, a percentage on time of 95.2.

The Trenton Division has a record of 92.2 per cent for trains making schedule time, and 86.9 per cent for trains arriving on time. The Pittsburgh Division is slightly below this, with a record of 91.1 per cent for schedule time and 82.3 per cent for trains arriving on time. Next comes the Philadelphia Division, with a percentage of 88.1 for trains making schedule time, and 80.2 per cent for trains on time.

On the New York Division, over which 67,180 trains traveled, the greatest number on any division of the Lines East, a record of 82.6 per cent was made for trains arriving on schedule time, and 77.4 for trains arriving on time. The Maryland Division also has a good record, for out of the 33,744 trains, 29,225, or 86.6 per cent, made schedule time, and 27,391, or 81.1 per cent, arrived at their destinations on time.

Order as a Factor in the Safety Movement.

WHILE order and cleanliness in all branches of the service is a vital factor in the successful development of the safety movement, these qualities apply with peculiar force to the reclamation plants of the railways, as in the handling of the various materials concentrated at such points, the hazard is unusually prominent. The accompanying photograph illustrates the order and neatness which prevails at the reclamation plant of the Frisco lines at Springfield, Mo. Despite the fact that old material from all over the line is collected and brought to this plant, it is



RECLAMATION PLANT OF THE FRISCO LINES AT SPRINGFIELD, MO.

classified and handled in such a way as to make conditions ideal in every particular. It will also be noted in the photograph that no material, tools or articles of any kind are to be found lying around the ground where persons are likely to stumble over them, nor is refuse of any kind strewn through the yards surrounding the buildings. If such conditions can prevail at reclamation plants, it can readily be understood that there is little excuse for lack of similar results at yards, roundhouses and shops.

The Safety Work of Southern Pacific Employes.

VICE-PRESIDENT and General Manager W. R. Scott, of the Southern Pacific Company, has addressed a letter to all employes of the system congratulating them upon the wonderful work accomplished in connection with the "Safety First" movement during the past year. Mr. Scott states that during the twelve months' period ending June 30, 1914, "there was a total of 4,013 safety suggestions submitted by employes, 3,621 of which, or over 81 per cent, were considered practical and placed in execution. These suggestions came from employes of every department and from every occupation. During the past year 50 per cent more suggestions were made than in the preceding year and over 81 per cent more practical suggestions were submitted. Compared with the number of employes in the service during the two years, there was an improvement of over 108 per cent in the number of practical suggestions per employe, which is a convincing figure of your interest and efforts."

Moving Pictures Employed in Greater Safety Work.

"STEVE HILL'S AWAKENING" is the title of the highly realistic motion picture play that has just been prepared by the New York Central Lines for use in connection with the company's educational campaign for safety. The pictures are well staged and vividly illustrate the typically unsafe practices of careless employes. The safety department of the New York Central Lines is to be congratulated on this interesting visualization of the causes of accidents it is so successfully striving to prevent, as shown by the company's record in accident reduction for the year.

How Safety Organizations Pay.

HOW the development of the safety organization has decreased casualties in the working force of the Whitacre, Glassner Company, of Wheeling, W. Va., is strikingly indicated by the accompanying diagram. During the period which this remarkable decrease occurred, the company suffered no loss of production, but on the contrary, the sum total of the safety work has resulted in a material increase in production throughout the plant.

At the Raritan Copper Works, Perth Amboy, N. J., during the year from September, 1913, accidents decreased 22 per cent. As the company's safety department has been in operation for little more than half of that period, however, the accident record really shows a decrease of 34 per cent. From September, 1913, to February, 1914, the accidents totaled 112; from March to September, 74.

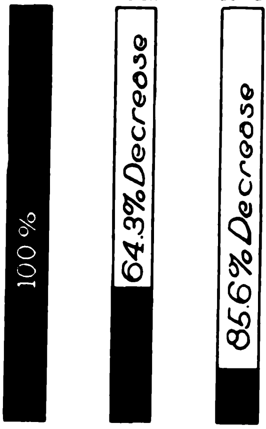


DIAGRAM SHOWING DECREASE OF PERMANENT INJURIES AT
MARTIN'S FERRY PLANT
WHEELING CORRUGATING CO.

The Copper Queen Consolidated Mining Company has just issued the first annual report of its safety department. It was difficult to make a comparison of the year's record with those of former periods, as complete accident records had not been kept previous to the organization of the safety department. Nevertheless, the company has found that fatal accidents have been reduced 55 per cent and serious accidents about 40 per cent.

These figures show what can be accomplished by co-operation. To every officer and employe in these organizations, credit is due for the splendid "Safety" records made by their companies.

Rock Island Places in Service New Combination Luncheon Dining Car.

THE Chicago, Rock Island and Pacific Railway has lately entered upon an experiment in lunch-counter service by transforming the passenger compartment of one of its regular 60-foot cafe coaches into a lunch room. In this compartment the original seats have been supplanted by the counter in connection with 12 revolving high-back stationary chairs. These fittings represent practically the entire expense involved in the transformation of the car, since the kitchen facilities already installed are depended on to serve also the lunch counter end. While a number of roads are trying the lunch counter scheme, this is believed to be the first instance in which the possible competition between the regular dining and the lunch counter service is to be tested out in the same car. Since both varieties of dining facilities are provided in such close relation to each other, a marked preference for one or the other, if it is to assert itself at all, should do so quickly and thus facilitate the determination of the advisability of extending either one, while at the same time the other is curtailed or discontinued.

As against the twelve chairs in the lunch counter compartment, there are seating accommodations for eighteen persons in the cafe compartment. On account of the lesser period or time that each average customer is likely to spend at the lunch counter, it would seem that the latter is capable of serving at least twice the number of patrons as the former with an equal or even greater margin of profit on the basis of money invested. The greater profit to the road in numbers of satisfied passengers as between the two kinds of service, depends on the prevailing desires of the passengers themselves.

This preference can only be determined after the car has been placed in actual service for some time, but in view of the employment of a combination car in which both classes are readily available, the company has adopted a most excellent method by which to determine which class of service is most popular.

LUNCH COUNTER IN ROCK ISLAND'S NEW COMBINATION LUNCHEON DINER CAR.

DINING COMPARTMENT IN ROCK ISLAND'S NEW COMBINATION LUNCHEON DINING CAR.

Mechanical

Reclaiming Waste and Scrap Material.

A. S. McKELLIGON, general storekeeper of the West Oakland general shops of the Southern Pacific, recently prepared the following statement showing the reclaimed waste and scrap material put into actual use at this shop from March 1st to September 30, 1914, a period of seven months. In the preparation of this statement, only material actually used was considered and the reclaimed material is figured at only half the price of the cost of new material. When it is considered that, in addition to the general shops at West Oakland, similar shops at Los Angeles, Sacramento and Portland, as well as division stores and smaller stores at various points on the line are all now employing methods of this character, it is easy to understand that the aggregate yearly saving must be enormous.

Air Brake Material—consisting chiefly of Cutout and Angle Cocks removed from Scrap Pipe	461.81
Brass, Copper and Lead—removed chiefly from Scrap Pipe, Hose, Castings, etc.	1,457.72
Pipe, Second-hand—sorted out from the Scrap	144.14
Fittings, Pipe—taken from Scrap Pipe 6,780 Fittings	228.36
Malleable Castings	561.88
Gray Iron Castings	113.95
Forgings	462.89
Bar and Angle Iron	64.52
Bolts, Nuts, Washers, Rivets, etc.	645.22
Couplers and Parts, Springs, etc.	1,368.95
Brake Beams	787.41
Track Bolts—49 Kegs (200 lbs. to keg)	145.31
Track Spikes—158 Kegs (200 lbs. to the keg)	315.20
Total	$6,757.36

Mr. McKelligon asserts that while the direct benefit of this reclamation has been great, it has likewise created a spirit of carefulness in using material on the line that is a great saving. Track men and station men are more economical and not so ready to discard material without a close examination as to its serviceability. Spikes are more closely picked over at the local tool house, pipe fittings on pipe and couplers and coupled parts are more closely scrutinized before they are condemned as useless. Tinware is being made over, for example, locally more than before. A. C. Carman at his mill has perfected a machine that makes car stakes from old piping butts and so on.

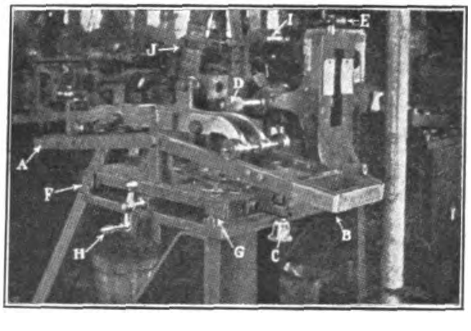
Reclamation is only possible with co-operation from every one. And reclamation consists not only in the recovery of good material from scrap, but also in the prevention of material that could be used in the locality being turned in to the supply car only to be again sent out somewhere else on the system. The principle of reclamation is not to "scrap" anything that is not scrap, and this applies to the actual use of any article in its present form as well as to making it over into another form.

It is surprising how much of second material has got good stuff in it; perhaps not serviceable in its present form but capable of being made over, wholly or in part, for some other use. Agents, trackmen, bridgemen and trainmen can save many dollars for the company if they will send in to the stores whatever they have that is no longer of any use to them. There may be something in the empty can or the old broom that is just what some other fellow on the other end of the system is looking for.

A New Machine for Grinding Locomotive Links.

WE are indebted to "Canadian Machinery" for the accompanying photograph of an interesting machine found in the shops of the Northwestern Railway at Chicago, which is used for grinding locomotive links and bushings. The illustration shows the machine set for grinding a block, and its particular advantages rest in the fact that there are no complicated cam movements or other attachments so common to machines made to perform similar work. While the feeding and rocking movements are done by hand, this is considered an advantage in the present form of machine.

The link or block to be ground is carried on a small wheeled truck, which is made to rock back and forth on the double-sloped track at A and B. The side A is stationary, but the side B may be adjusted up or down by means of the hand-screw C, to change the radius of grinding when desired. The grinding wheel D may be raised or lowered by means of ball crank E. The work truck, tracks and table, are carried on crossways F and G, and may be run out or in by turning ball crank H. A belt tightener at I keeps the belt taut at all times, and a suction pipe J carries off the dust. As both the link and its block can be ground on the machine without changing the track slope or radius, as accurate a fit as desired may be obtained.



MACHINE FOR GRINDING LOCOMOTIVE LINKS AND LOCKS.

Economy a la Louis Brandeis.

THAT railroad economy means more than so many empty words and that it is being practiced by the big roads systematically wherever possible is shown by one of the methods adopted by the Baltimore and Ohio Railroad in sending mail matter between departments over the system by train service.

The road has adopted a form of envelope which is not to be sealed and containing space for twelve addresses. When mail is received by a department, its address is struck off and the envelope saved for further use. In this manner an envelope was received in the vice-president's office on its twelfth trip after having traveled 20,000 miles. The office boy was sorry it could not be turned inside out and used twelve more times, as the paper was not torn.

The Rail Equipment of the New York Subways. Flange Lubrication.

THE following description of the rail equipment of the New York subways delivered in an address before the New York Railway Club on October 16th, by O. O. Dixon, assistant engineer of the Interborough Rapid Transit Company, will prove of particular interest to mechanical and operating railway officers in view of the enormous traffic of these subways, and the unusual strain and wear to which these rails are constantly subjected.

"The rails originally installed were the American Society of Civil Engineers 100-pound section, manufactured at Sparrows Point, Md. They were 33 feet long, laid on soft steel tie plates 5-16 inch thick and 4⅞ inches wide; they were laid with suspended joints, each joint being opposite the middle of the adjacent rail and spliced with 24-inch four-bolt angle bars.

"On curves the same construction was used, with the addition of an inclined guard rail which was bolted to the low rail about every three feet, using adjustable cast iron separators to take up the wear. The curves were laid to 4 feet 8½ inches gauge. The flangeways varied from 1¾ inches to 2¼ inches. For practically all frogs 1¾ inches was used. For all switches and on curves having a radius of 500 feet and above, a flangeway of 2 inches was used. On curves having a radius less than 500 feet the flangeway was 2¼ inches. The maximum super-elevation was 6 inches.

"The subway had not been long in operation when it was found that improvements should be made in the track.

"The inclined guard rail was so flexible that it concentrated the pressure on bolts causing frequent breakages and when the bolts held, the wheels were allowed to side slip between the bolts, due to the flexibility of the guard rail and considerable corrugation was due to this cause. This guard rail was replaced by a guard rail of the same section as the running rail, having one flange sheared off and the adjustable separators abandoned, using a one-piece separator to give the correct flange-way. The gauge of track on the radius, 4 feet 8½ inches for all curves was slightly widened on sharp curves depending above 500 foot radius, 4 feet 8¾ inches for curves between 200 feet and 500 feet, and 4 feet 9 inches for curves less than 200 foot radius.

FIG. 2.

"These changes were found to increase the life of the running rails on sharp curves about 25 per cent.

"Before taking up the discussion of rail wear a brief description of the changes in chemical composition will be given. The original rails were manufactured by the Bessemer process and had a chemical composition as follows:

Carbon	.50 to .63
Mang.	1.00 to 1.10
Phos.	.08
Sul.	.05
Sil.	.07

"Chemical analyses were made of the worn rails to determine the cause of the rail wear and corrugations, expecting that it might be due to a lack of uniformity in the steel, but practically no difference in composition was discovered.

"The specifications were gradually changed to get a better wearing rail and one that would not corrugate. As renewals were made rails having a higher percentage of carbon were installed.

"Some averages of carbon and manganese, also deflection tests from 1907 to 1913 are as follows:

Brand		Analyses		Height of Drop	Deflection
Bessemer	1907	C. .59	Mn. .93	18 ft.	1.2 in.
"	1908	C. .602	Mn. .97	18 ft.	1.19 in.
Open Hearth	1908	C. .84	Mn. .74	16 ft.	....
"	1909	C. .77	Mn. .74	16 ft.	1.2 in.
"	1910	C. .78	Mn. .76	16 ft.	1.06 in.
"	1911	C. .799	Mn. .78	16 ft.	1.14 in.
* "	1912	C. .788	Mn. .88	15 ft.	.95 in.
"	1912	C. .79	Mn. .82	15 ft.	.93 in.
"	1913	C. .80	Mn. .85	15 ft.	.95 in.

*Rails treated with Ferro Titanium.

"This change in percentage of carbon was found to give better results. At present we specify carbon .75 to .90, with an average of not less than .80, and manganese .60 to .90.

"In studying the problem of rail wear it became apparent that the shape of the rail head was not suitable to our conditions, 20 per cent of the subway tracks being curves.

"Fig. 2 shows the result of this study. The shape of the rail head was changed from that shown in diagram A to that in diagram B during the year 1909—the object being to increase the area of contact during the first period of the rail's life, and also to decrease the tendency toward corrugation, by sloping the side of the rail head to conform nearer to the shape of the wheel. As will be seen from the table of Fig. 2, the vertical wear is slightly increased, and the horizontal wear decreased, thereby increasing the life of the rail.

"Fig. 3 is a comparison of rail wear and tonnage for Bessemer, Open Hearth and Manganese rails. This figure shows sections of worn rails on the high side of curve of southbound express track at Grand Central, and is typical of other curves, changing slightly with conditions.

"The following table gives a comparison of the life of the rails and tonnage passing over the tracks at the curve above referred to, having a radius of 220 feet, and a grade of 1.15 per cent down, and over which the average speed is 18 miles per hour:

Rail	Carbon	Tonnage	Loss of Area in sq. inch	Sq. inch loss in Sec. per million tons	Life
Bessemer	.59	12,873,436	1.35	.105	4 M. 10 days
Open Hearth.	.84	42,072,387	1.86	.044	12 M. 5 days
" .	.78	32,702,458	1.13	.035	7 M. 20 days
Manganese ...	1.16	67,952,189	.75	.011	14 M. 27 days

"The figures show that in a comparison of Bessemer and Open Hearth rail in general the wear is about 1 to 2 in favor of Open Hearth. The ratio of wear of Manganese to Bessemer is 1 to 9; the ratio of wear of Manganese to Open Hearth is 1 to 4½.

"The Open Hearth rails shown in diagram "C" are slightly better than the average. This is due to a higher percentage of carbon .84, as compared to an average of about .80 in other cases. Also more time had been spent in handling the metal before rolling than is customary.

"Bessemer rails being soft prove more liable to corrugation than the harder rails. As these figures show, the Manganese rail has proven satisfactory except for the fact that like all other rails it is liable to become corrugated.

"A peculiar instance of this occurred at Times Square on the southbound express track. One rail near the middle of the curve became corrugated, was taken out and placed on the tangent at the trailing end of the curve. The gap was closed by moving the rails together. The result was that all the rails became corrugated and the rail placed on tangent ironed out smooth. We have, therefore, found it better not to patch a curve by removing a single rail, but instead to renew several rails.

"Manganese rails are now being used on most of the important curves in the subway with somewhat varying results, but we believe that it pays to use Manganese if the price is not too high; for as can be seen from the table, renewals are less frequent.

"Owing to the fact that the subway passes so close to building foundations and in some cases through the building, rail corrugation is serious for in some cases it leads to vibration. In order to overcome the vibration the rails were frequently renewed and a system of spring track was installed, as shown at Fig. 3A. This is a section of the southbound express track at Times Square curve and is directly over the press room of the New York *Times*. Similar construction has been followed at other points of the subway and we believe this construction has helped to produce better results.

"We have very little trouble with rail failures in the subway and among the few cases that have occurred the Manganese rail failures are in the same proportion to that of the Bessemer and Open Hearth, as the tonnage of the various kinds of rails used. Should a rail fail during the rush hours we renew it with practically no interference with traffic."

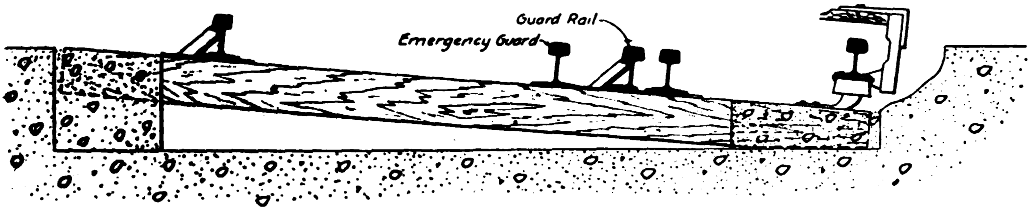

FIGURE 3A

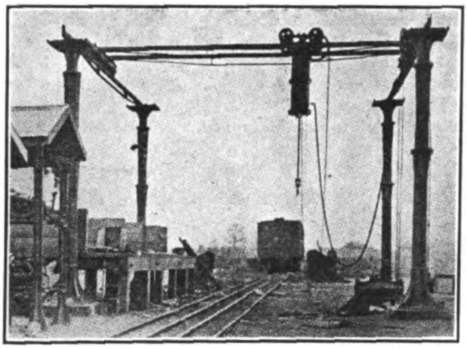
Grand Trunk Yard Crane Built from Scrap.

RAILWAY scrap has been put to a number of novel uses in the past, but we doubt if it has ever before been employed for the construction of a yard crane. The accompanying illustration shows a small traveling crane erected at Allendale, Ont., by the Grand Trunk Railway for the purpose of handling the various heavier parts that must be cared for at a divisional point. The crane runway consists of four cast iron columns removed from the Company's old shops at Stratford, Ont., spanned by trussed rails which form the crane track. The crane itself also consists of a pair of truss rails suitably mounted at the ends of small carriages which run on the runway. A small crane carriage, operating on the crane rails, carries an air plunger hoist. The crane was primarily installed



Grand Trunk Yard Crane at Allendale, Ont., Largely Constructed from Scrap Material.

for the purpose of lifting tender tanks from tender trucks for repairs, but has also proved to be useful in handling scrap material from the small shop trucks to the scrap bins as shown in the left of the illustration, for which we are indebted to the "Canadian Railway and Marine World."

A Convertible Stock Car.

THE Chicago, Milwaukee and St. Paul Railway is experimenting with a form of stock car having the supplementary deck arrangement in such a manner as to permit it to be lowered to a position where it rests on the main deck, thus allowing the car to be used not only for the transportation of cattle and other smaller animals, but also for the transportation of those various commodities that are occasionally shipped in the ordinary form of stock car.

The car with which the St. Paul is experimenting, has been so constructed that the supplementary deck has sufficient clearance on all sides to permit of it being elevated to the desired height for double deck loading. A shaft having right and left hand threads suspended from the roof at the middle of the car and operated by means of a ratchet lever, is employed to elevate or lower the deck. It requires but one man to operate it and a change of position can be accomplished in five minutes or even less. The accompanying elevation view gives a general idea of the car, which was fitted out at the St. Paul's shops at Tacoma, Washington.

Flange Lubrication.

AT its September meeting the Western Railway Club was addressed on the subject of "Flange Oilers," by Mr. F. W. Edwards, who said in part:

"The history of the flange oilers goes back to 1900, and I dare say the name 'Flange Oiler' confuses a great many. One of the first statements made to us when we say 'Flange Oiler' is that it will grease the tread of the driving wheel and cause slipping. The name possibly implies this, because to oil a surface suggests to make it slip, or pass easily over the opposing surface. The name might be put in the form, 'The Flange Friction Eliminator,' but that being too long a name to use, and 'Flange Oiler' answering the purpose, we adopted that name for the device.

"The original flange oiler was a piece of waste attached to the frame of the engine, with a piece of wire in a position so that it would come in contact with the driver wheel flange. When the engineer was oiling around he would drop some oil onto this waste; a small portion of this oil would reach the flange. The crudeness of this method was wasteful in the use of the oil, but some small benefit was derived.

"The next advance was a crude tin can, mounted on a bracket attached to the engine frame. From this can a pipe with a wick in the end was projected to a position over the driver wheel flange. After the can had been filled with black oil, the wicking was supposed to form a circuit between the oil in the can and the driver wheel flange. That helped the flange a little, but helped the driver wheels to a greater speed without advancing that engine and train any nearer to the division terminal.

"From this crude tin can arrangement the advancement was made with more devices of the same general character, and the addition of a flexibly mounted shoe that was always in contact with the flange.

"The use of the flexibly mounted shoe developed two noticeable facts. It was hard to keep the shoe in position and the oil was carried over the tread, due to the lateral motion.

"In 1904 the development reached a higher standard and a more perfect arrangement of the flange oiler. This year brought out what is sometimes called the 'Hydrostatic Flange Oiler,' so termed because it works on the condensation displacement principle. By putting this development through a refining process, the perfect working and result giving hydrostatic flange oiler was made a reality.

"To satisfy ourselves more thoroughly as to the safety connected with flange oiling we made a careful study of road conditions on both mountain and rolling country where sharp curves were a necessary part of the road construction. In many places the statement was made (before the flange oiler was applied) that the engines tried to take a short cut across the curve instead of following the track as a well behaved engine should. But since the application of the flange oiler they hardly knew a curve was there.

"The application of the flange oiler to high speed passenger engines running over this severe track gave the enginemen a feeling of safety and confidence they had never felt before.

"The inspection of the east end of the yard, where the flange oiler was not in use, showed the inner edge of the rail ball to be badly worn and the switch points were ground to a ragged edge and the crossovers badly cut. Evidence of the rail cutting was present everywhere in the shape of finesteel flakes. This evidence was not only on the ground along the side of the rails, but the engine frame was coated with the steel flakes because of the excessive rail and flange wear. From this we must conclude that the rail wear can be prevented by the use of the flange oiler with proper oil.

"It is a known fact that where there is excessive wheel flange wear there is also excessive rail wear, and the remedy for one is the remedy for the other. The flange oiler is the remedy and it has proven so effective that it would be a paying investment for the railroads if they equipped their engines with flange oilers for the saving of the rails only.

"Let us now investigate and see if the flange oiler is not also an important factor in fuel economy. The cause of flange wear is friction; the more friction there is between the wheel flanges and the rail the more train resistance is developed, and the higher this train resistance becomes the greater is the fuel consumption to haul a given amount of tonnage. This will all bear careful study, because the facts are there and it only requires some thought and application to bring them out. Some of the careful and observant engineers have discovered these facts because they have noticed the engines were not consuming as much coal and water after the flange oilers had been applied. It might be said that engineers in this class would make a showing without the use of the flange oiled. Truly they would make some showing, because they are careful and observant of all engine conditions and operations, and that is the very reason these same engineers would make a better showing and more saving if the engines were equipped with a device to prevent wheel flange friction. They would make a saving on their coal pile and that would make a big addition to your fuel economy record.

"The initial cost of a flange oiler which will reduce the cost of locomotive repairs and track maintenance, and show economy in fuel—which is necessary in the operation of railways to-day—is approximately $75 to $85 applied to a locomotive. The oil will cost from 16 cents to 18 cents per gallon, and one gallon will lubricate from 500 to 800 miles of engine service, which would make the cost about two cents or three cents per 100 miles for oil.

"The cost of turning the tires on the average locomotive and the value lost in service, which on an average is about $125 to $200 per day, will more than pay for the initial cost and application of the flange oiler, say nothing about the increased tonnage, fuel economy, derailments eliminated, saving on switch points and frogs, higher speed on curves with the greatest element of safety, and more than doubling the life of rails on curves.

"In conclusion, it is necessary to outline some of the important points that should be considered, if you contemplate the application of flange oilers. Purchase the best flange oiler possible and one that is not an experiment. Choose one that will deliver a heavy asphaltum oil onto the flanges and not onto the tread of the wheel. If grease or greasy oils, paraffine oils, or if crude oils that have a grease or paraffine oil base, are used, they will spread to the wheel tread or top of the rail and cause drivers to slip, and you cannot expect to secure the results sought for.

Painting of Steel Car and Locomotive Equipment.

THE members of the Central Railway Club listened on November 13th, to an interesting address by Milton L. Sims, special railway representative of the Sherwin-Williams Company, of Cleveland, Ohio, on the: "Painting of Steel Car and Locomotive Equipment." Mr. Sims considered separately the steel coach, the steel freight car and the locomotive.

In preparing the exterior of a steel coach for painting he considers the sand blast as the safest and most economical method. For the interior of the car, he recommends the use of linseed oil and benzine or gasoline in the proportion of one part of the oil to two parts of the benzine applied with a brush rubbed down with emery cloth or paper. The sheet steel used on the interior being of lighter weight and finer texture, does not, in his opinion, need the sand blasting to get excellent results. The priming coat should be applied as soon as possible after the surface has been cleaned and this applies particularly to the outside, as corrosion often starts a few hours after the sand blasting process has been used. In describing the various coats and their method of application, Mr Sims spoke as follows:

"The priming coat is the most important one of any that is to follow, except the coats of finishing varnish, and too much care cannot be exercised to see that it is done thoroughly, brushed out evenly and every bolt head and joint coated perfectly, using suitable brushes for the purpose. This priming coat must be made from suitable pigments and carrying vehicles, finely ground and thoroughly incorporated together to work freely and spread smoothly under the brush, dry hard, but elastic enough to safely withstand the contraction and expansion of the steel surface, which varies greatly in different sections of the country. The solid through trains running from the ice and snow of the North to the tropical climate of the South, has a marked influence in producing cracking and disintegration of paint and varnish films as applied to steel cars much more than wooden cars.

"When this priming coat has dried safely, the next step is to hard putty and glaze coat over all rough places and this takes us to the second coat or brush surfacer, which is designed to fit with the priming coat. This material must also be finely ground, work and spread easy over large surfaces. It must dry hard, but elastic, and be made from well known and selected materials. The next step is to apply a much heavier bodied surfacing material, which is then knifed off, leaving a very smooth surface, which requires very much less rubbing to bring the surface up ready to receive the color coats. The old method of using block pumice stone and water, is dispensed with, and a more modern and safer method of rubbing the surface down smooth by using emery cloth, in connection with equal parts of raw linseed oil and benzine, and then washing or wiping off with rags or waste, and clear benzine or gasoline. This method of surfacing does away with all danger from moisture and prevents the starting up of corrosion where any sharp edges or bolt heads may be cut through to the steel. The oil forms a good sealer for the more or less porous surfacing material and forms a safe foundation for the succeeding color and varnish coats.

"One coat of specially prepared car body color is now applied. When this is dry, a second coat of specially prepared car body color is applied, which is of an elastic enamel quality, dries hard with a semi-gloss, but makes an elastic surface suitable for striping and lettering. After which two coats of durable outside finishing varnish are applied, and the outside of car is ready for service.

"The same priming material shall be used on the interior surface and then followed up with the second coat of brush surfacer. The heavy coat of knifing material can be dispensed with and after the rubbing with emery cloth, oil and benzine has been finished, then follow with a suitable ground work for graining in imitation of natural woods, after which apply two coats of elastic rubbing varnish. Rub to a dead finish with rubbing oil and pulverized pumice stone, or polish if desired. When solid colors are used on head and side linings, an option is given for the use of special enamels, or quick drying elastic headlining colors to be striped and varnished over."

Mr. Sims has prepared the following schedule, which he believes can be applied to advantage in painting steel passenger coaches:

SCHEDULE FOR PAINTING EXTERIOR OF STEEL PASSENGER COACH.

First day.—Apply priming coat.

Second day.—Hard putty and glaze all rough and uneven parts of surface.

Third day.—Apply coat of brushing surfacer.

Fourth day.—Apply coat of knifing surfacer.

Fifth day.—Rub out with emery cloth, using half and half raw linseed oil and benzine, instead of block pumice stone and water.

Sixth day.—Apply first coat of car body color.

Seventh day.—(If Sunday), drying.

Eighth day.—Apply second coat of car body color enamel.

Ninth day.—Stripe and letter.

Tenth day.—Apply first coat durable outside finishing varnish.

Eleventh day.—Drying.

Twelfth day.—Apply second coat of double outside finishing varnish.

Thirteenth day.—Car is completed.

LOCOMOTIVE PAINTING.

The method used in painting a locomotive, differs very slightly from that of a steel coach. The same primer and surfacing materials are used and rubbed out in the same manner. Then the color coats which are usually black, are applied.

For this purpose an enamel black is used on which the lettering is done and one coat of durable finishing varnish is usually applied on the water tank or tender, cab, steam dome and sand box, steam chest and cylinder casings, etc., for best work. The enamel black should be made from selected materials which are known for their wearing and heat-resisting qualities. If the surfacing materials are made too rich with oils, blistering on the heated surfaces will often result.

Speed is demanded in locomotive painting, as each day that a locomotive is kept out of service, represents so many dollars of earning power for the railroad company. The machinists, boiler makers, pipe fitters, etc., usually get all the time and the painters get what is left, but it cannot be helped, as time means money here as elsewhere. The actual time necessary to turn out a satisfactory job, depends on shop conditions. Two and often three operations on the schedule can be carried out safely in one day.

SCHEDULE FOR PAINTING A LOCOMOTIVE.

Assuming that the same care has been taken in removing all grease, scale and corrosion from the surface to be painted, proceed as follows:

First day.—Apply priming coat of special locomotive primer.

Second day.—Hard putty and glaze coat all rough and uneven surface. (This does not apply to trucks, framework, etc.)

Third day.—Apply brushing and knifing surfacer to water tank or tender, cab, steam dome, sand box, etc.

Fourth day.—Rub out surface with emery cloth, using half and half raw linseed oil and benzine. Wipe off dry with rags or waste and clean benzine, being careful not to use too much benzine. Follow up with coat of black enamel. On best work a coat of flat black is applied over all surface, except trucks, frames, etc., before the black enamel coat is applied.

Fifth day.—Letter and finish with a coat of durable locomotive finishing varnish.

Shorter and quicker methods are not reliable or recommended, except for re-painting and repair work.

PAINTING STEEL FREIGHT CARS.

The methods of painting steel coal cars has changed very materially in the last few years. Formerly all coatings were made very elastic and very little attention was given to make the first or priming coat, dry any different from the last or finishing. Research work on this matter has proven that the method was wrong and that the first or priming coat should, by all means, be constructed so as to dry hard and elastic, using specially treated vehicles for the purpose and such pigments as will be neutral and last the longest. The finishing coats made more elastic and to have more gloss and moisture-resisting qualities.

The reason for the priming coat being made to dry harder and with less gloss, is that coal cars are subjected to rough usage while being loaded and unloaded. Large lumps of coal striking the sides of the cars glancing blows, soon knock off much of the painted surface when the elastic coatings are new.

Grand Trunk Adds Correspondence Course to Training Apprentices.

MR. W. D. ROBB, the general superintendent of motive power, has some six hundred apprentices in his department of the railway's work, the young fellows being trained in the various locomotive shops of the company at Montreal, Stratford, Battle Creek and other points. The benefits of this training are such that boys are sent from all parts of the American continent, and even from Europe to take their apprenticeship here. If they pass their entrance examination they are given a trial of from two to three months in the shops and if satisfactory are asked to sign indenture papers binding them for the period their trade calls for—machinists for five years, patternmakers and boilermakers for four years.

During this apprenticeship the boy has to attend classes arranged by the company and is taught mechanical drawing and practical mechanics.

Examinations are held periodically to test the knowledge of the boys and at the end of the term a final examination is arranged for the whole system, the marks being compiled and the station having the highest percentage receiving a cash prize donated by the company. Individual prizes are also given to the boys.

This year it has been decided to improve the opportunities of the apprentices at small stations where it has not been possible to keep instructors. Correspondence courses, mapped out along the most improved lines, have been adopted for this purpose and the boys will be in touch in their theoretical studies with headquarters in Montreal. Text books have been compiled by the company both in drawing and mechanics suitable to the requirements and these have been made as practical as possible, so that the practical work may line up with the theory taught.

A Safety Track Spike.

THE Railway Safety Spike Company, of Richmond, Va., has placed a new safety spike on the market, which, it is claimed, presents a greater resistance to side thrust and vertical pull than the ordinary spike. It is at the present time, being tried out by a number of roads including the Chesapeake and Ohio, the Seaboard Air Line and the New York, New Haven and Hartford.

The distinguishing features of this spike are the two projecting wings on the sides of the body to increase its resisting power to the lateral movement of the rail, and the notches on the front and back edges below the wings to increase its resistance to an upward pull. It is stated that the displacement of fiber by this spike is only .012 cu. in. greater than that of the ordinary track spike, and that the resistance to lateral movement is increased more than 300 per cent.

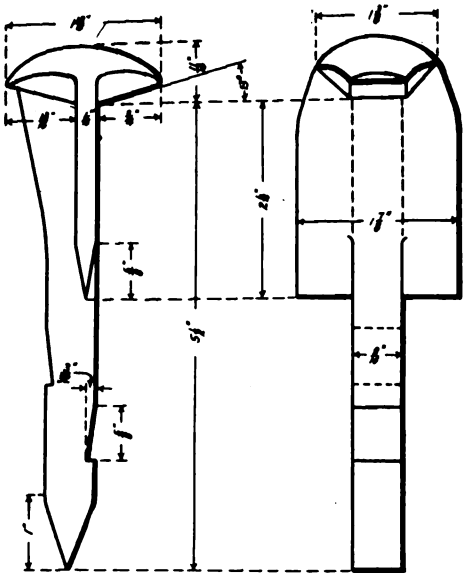

DIAGRAM OF SAFETY TRACK SPIKE FOR WHICH IS CLAIMED A GREATER RESISTANCE TO SIDE THRUST AND VERTICAL PULL THAN THE ORDINARY SPIKE.

The new spike is made of low carbon steel, ranging from .12 to .20 per cent of carbon, and having a tensile strength of 5,500 to 6,500 lb. per sq. in. The spikes are made by the drop forge process, giving uniform strength, particularly at the throat where the common spike is apt to be weak on account of its manufacture by the upsetting process. The throat is reinforced by additional metal on the back just under the head, giving it added strength when reversed to be used in the slot of an anglebar.

It is thought that the advantages of the new spike will be most fully realized on curves and at switches where rail spreading is most common. It is declared that the use of these spikes will allow rail-braces to be eliminated at such points, saving the cost of these devices and reducing the number of spikes about sixty per cent. The spike can be applied with a maul and pulled with a clawbar, in the same manner as an ordinary spike.

A special tie plate for use with these spikes, if tie plates are desired on curves, has also been designed by the same Company.

Southern Pacific's Safety Campaign.

THE Southern Pacific, during the past ten months, has given instruction in "safety first" to many thousands of people, not employes—citizens in the larger towns on its lines; and at the same time has advertised its own efforts in the same line by exhibiting models of semaphore signals, hiring rooms for the purpose and employing a regular lecturer. The visual instruction in cautiousness is conveyed by means of large photographs, about a hundred of them displayed in a booth; and whatever urging may be necessary to induce people to walk in and examine the pictures is accomplished by means of the semaphores which are so manipulated as to be an attraction even to the careless.

The pictures illustrate those accidents commonly involving the public, such as trespassing on tracks, automobile drivers approaching crossings not under control, and passengers unnecessarily assuming dangerous positions on trains in motion. In addition to these the results accomplished by the company's "safety-first" organization are illustrated by views of machinery before and after safeguarding and other well known precautions.

All of the pictures, together with statistical accident charts, are displayed in a portable booth 24 feet long, 15 feet wide and 14 feet high. The booth is a counterpart of the one used for the Southern Pacific display at the International Exposition of Safety and Sanitation, held in New York last year. The exhibit travels on an itinerary similar to those of theatrical companies. Advance press notices are published, giving the date and purpose of the exhibition. After the installation of the exhibit, accounts showing accident statistics and other interesting narratives are published in the newspapers. It requires but a day to install and a half a day to dismantle the booth. Where available a vacant store in the business district of each town is selected for displaying the exhibit.

The display of the miniature model of the automatic block and interlocking signals is popular. The public generally is interested in learning the manner in which signals operate and the demonstrations attract many. At the conclusion of each signal demonstration attention is directed to the accident pictures and a brief statement of the purpose of the exhibit is made by the demonstrator in charge. Few people leave the booth without studying the pictures and descriptive data.

A chart setting forth statistics relevant to the carelessness of the great majority of people when crossing tracks at grade is also displayed. These figures, compiled from tests made last year by the Southern Pacific, show, as has been shown elsewhere, that exceedingly few persons stop and look in both directions before crossing tracks, 69 per cent of automobile drivers observed took no precautions whatever, neither stopping nor looking in either direction. Emphasis is given to the fact that the greater proportion of trespassers killed are wage earners and not hoboes, as is commonly supposed.

The exhibit has been entour since January of this year and with the fulfilment of the itinerary it will have been displayed in all the larger towns on the Southern Pacific System, and will have been attended by 100,000 people; and approximately $5,000 will have been expended in its management.

Electrical

Another New Electric Alpine Railway.

By Marie Widmer.

AT 6000 feet above sea-level and at a distance of 18½ miles from Chur, the historic capital of the Grisons, lies one of the most enchanting of the Swiss Alpine resorts—Arosa. Meadows resplendent in tender green and profusely interwoven with floral designs form a luxurious cushion on which this lovely jewel is reposing, right in the midst of a setting of fragrant pine-forests and a glorious cluster of snow-crowned Alpine peaks. It is a spot which is well known for its salubrious climate, its even temperature and abundance of sunshine—advantages which have rapidly made it famous as a health and pleasure resort.

Arosa is a veritable gem of tranquil beauty. It is far distant from the nerve-racking noise of the every-day traffic and far away also from the "beaten paths," so much dreaded by the carefully exploring tourist. In summer it has been the picturesque diligence which afforded a means of communication with the outer world and in winter, when King Zero laid down his thick carpets of snow, it was the merry tinkling sleigh which climbed from the valley to this sunlit realm glistening in its array of crystals and ermine.

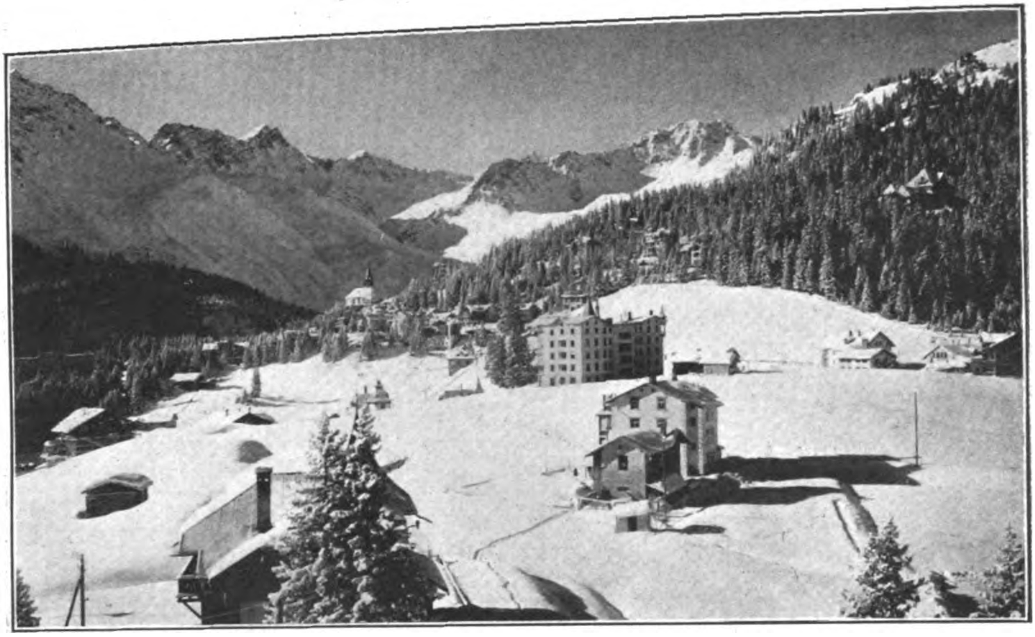
Modern conditions have, however, called for an improvement. The growth of the community which now presents that familiar and pleasing picture of humble, nut-brown chalets and elegant hotels, made swifter transportation a necessity.

It required a great deal of hard work and eloquent persuasion on part of the originators of the project, until they finally succeeded in 1912 to form a company, with the co-operative support of the Canton of the Grisons, the City of Chur, the Rhaetian Railway and all the communities along the line to be constructed. In the autumn of that year the great work was started and it is anticipated that the railway will be opened for traffic within a few weeks, in spite of the present conditions in Europe.

The starting point of this newest electric Alpine railway is in closest vicinity to the railroad station of Chur, situated at an altitude of 1925 feet above sea-level. The terminal of the line which is a meter gage, adhesion railway, is on the border of the Obersee in Arosa at an altitude of 6000 feet above sea-level.

Following the carriage road along the swift river Plessur, we immediately begin to climb, through wood-clad heights. Maladers, Castiel and Luen, three typical Grisons villages greet us with the welcome smile of the Schanfigg Valley which we have entered. The little communities lie scattered over the mountain-side, but each is the proud owner of a brand new railroad station in the dainty chalet style, so that the invasion of this blissful country by the railway does by no means impair its glorious natural beauty.

The valley begins to assume an aspect of wild grandeur. Gorge follows gorge and the foaming waters of the Plessur thunder in wild anger below. Bridge follows bridge and although the river is crossed but once—at Langwies, there are between Chur and Arosa not



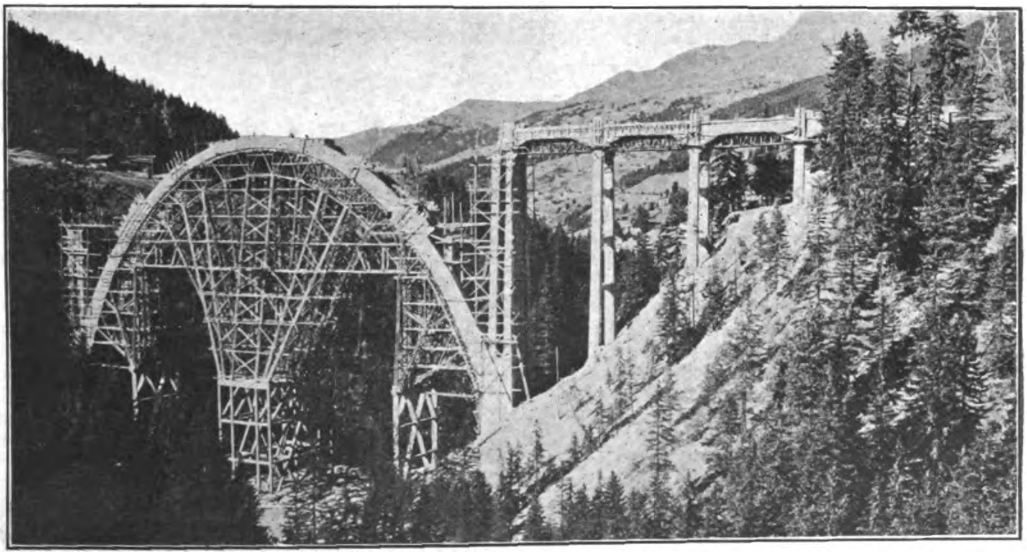
Arosa, the Swiss Alpine Resort and the Terminal of a New Swiss Electric Railway.

fewer than 27 bridges of stone, three of iron and two of concrete, as well as 19 tunnels with a total length of 7,800 feet.

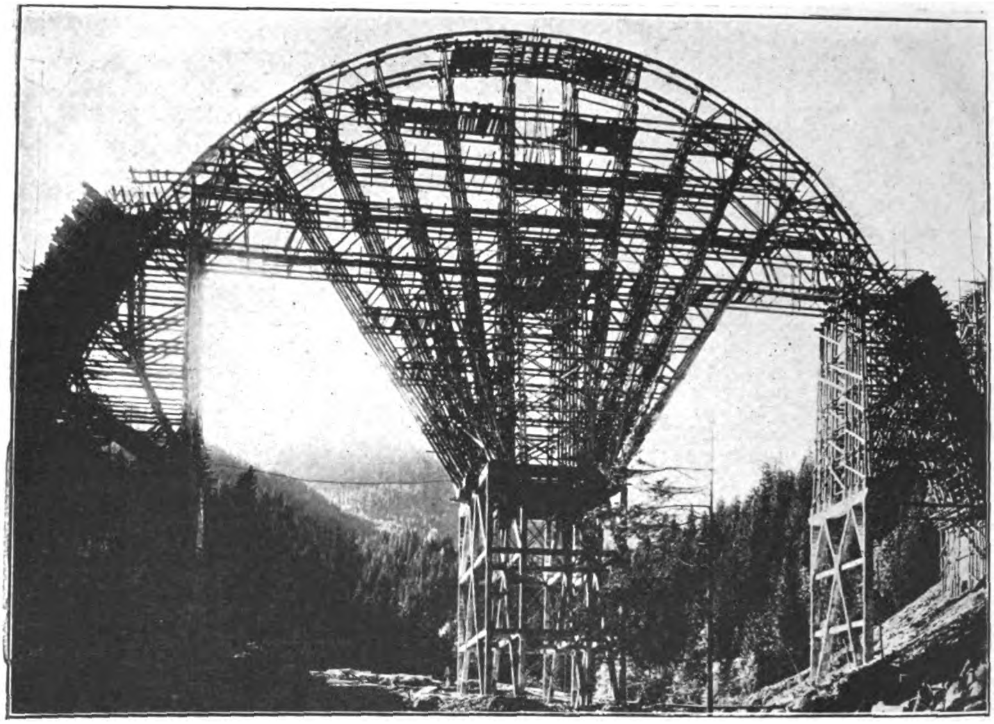
Before we reach the village of Langwies, we perceive in the distance the outline of a boldly constructed arch. This is the viaduct of Langwies, the masterpiece of the Chur—Arosa railway and one of the most remarkable bridges in the whole of Switzerland. The main arch of this bridge, which is the second longest masonry arch in the world, has a clear span of 315 feet and a height of 140 feet. The viaduct itself measures 960 feet in length and shows a grade elevation of 207 feet above the valley.

The material of the arch and the pillars contains portions of iron, which are practically forming the invisible skeleton of the same; the principal building material consists however, of a combination of gravel, cement and sand, the durability of which has been found far superior to stone. While a stone bridge necessitates a very solid and heavy construction, a structure of this material can be much lighter. The viaduct of Langwies with its gracefully curved arch may look frail to many, yet with the new and scientific distribution of the building material, it has been made perfectly safe and strong.

The Calfreis viaduct, between Maladers and



Gigantic Viaduct Near Langweis, Switzerland, on the New Electric Railway Between Chur and Arosa.



Closer View of the Gigantic Viaduct Near Langweis. This Will be the Largest Masonry Arch Thus Far Constructed in Switzerland.

Castiel, is another remarkable feature of the line. Two central arches with a respective span of 83 feet and 60 feet have been built of concrete blocks and the four lateral arches of 40 and 20 feet each are of tamped concrete.

At Langwies the Schanfigg valley makes a sharp curve to the south. Sombre pine-forests climb from the turbulent riverbed far up into the barren regions of rocky cliffs. To our left towers the Thiejerfluh, famed for the number of avalanches which precipitate themselves down into the valley like gigantic volleys of dust. A melancholic stretch of land many believe, but they are unaware of the existence of the flowery pastures which are hidden higher up, with tiny lakes dotted here and there and with the fair "Alpenrose" blooming in bewitching profusion. A visit to this idyllic spot is, however, an easy matter from Arosa, as a well kept bridle-path leads by way of these pastures to the "Rote Tritt"—a favorite point of view, and on to Tschiertschen and Chur.

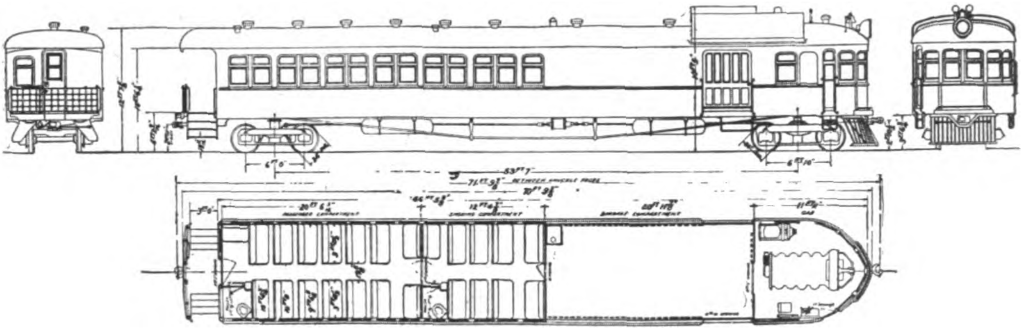
Ruti, the last station before Arosa beckons us. To those who are acquainted with this district in winter it is a well known friend, it being the finish of the famous bobsleigh run Arosa-Ruti. Once more the train disappears in the forest, but it is only for an instant and presently we are surprised with the dazzling vision of a majestic mountain pyramid—the Schiesshorn, and a glimpse into a valley of entrancing beauty, the Welschtobeltal. A last short tunnel and the village of Arosa is spread before us.

The journey which took six hours by the "old way" requires much less than half the time by the "new way" and the traveler still gets the full benefit of the view. The Chur-Arosa line is not what could be termed as merely a "tourist railway." It is a line which will bring another of the exquisite side valleys of the Grisons in closer touch with the world. And especially in winter-time it will be hailed as a wonderful convenience by many who may not have felt equal to the long drive or whose limited time may not have permitted such a side expedition by diligence or sleigh.

New Construction in Gas-Electric Motor Cars.

THE Spokane, Portland and Seattle Railway has contracted with the General Electric Company for a gas-electric motor car having a baggage compartment about twice the usual length, in order to supply sufficient space for the large quantity of express handled particularly during the fruit season. This car is to be placed in operation between Portland and Ranier, Ore., the service for which it is intended being performed at the present time by steam trains. This service will require four single trips a day, or a total distance of 183 miles and the new gas-electric car will be required to haul regularly, one twenty-five ton trailer, seating sixty passengers, and, during times of heavy traffic, a second trailer of the same weight and capacity.

The dimensions are 70 feet 11⅜ inches over bumpers by 10 feet 6⅜ inches wide over all. It weighs approximately 51 tons and has a seating capacity for 68 passengers. The interior is partitioned into four compartments. The cab in front containing the power plant apparatus meas-



General Plan and Elevation Views of New Gas-electric Motor Car for the Spokane, Portland and Seattle Railway.

ures 11 feet 11 inches long; next is the baggage room, 20 feet 10⅞ inches long; then the smoking section, 12 feet 6 inches long; and the passenger compartment 20 feet 5⅞ inches long.

Electric Car Lighting.

THE American Electric Railway Association held its thirty-third annual meeting at Atlantic City from October 12 to 16 inclusive. In the engineering section of the Association, there were a number of reports and papers presented that possessed matters of interest to the officers of steam railways though they dealt primarily with those pertaining to the electric railway. The papers presented were as follows: Constitution and By-Laws; Power Distribution; Standards; Electrolysis; Accident Prevention; Block Signals; Transportation Engineering; Equipment; Buildings and Structures; Life of Railway Physical Property; Engineering Accounting; Power Generation; Way Matters; and Heavy Electric Traction.

The report on the treatment of car lighting in so far as it relates to the lamps used, is of particular interest to railway officials, and we quote therefrom as follows:

"The regulation of a carbon lamp is very poor, the intrinsic brilliancy of the filament varying considerably with slight changes in the current passing through it. With varying voltages at the lamp, the intrinsic brilliancy of the filament is constantly varying, and therefore the amount of light obtained from the lamp is also varying, as the amount of light varies directly in proportion to the brilliancy of the filament. The character of the carbon filament is such that its electrical resistance varies with its temperature. As the carbon is heated, its resistance gradually drops, permitting more current to flow through it, this change in resistance occurring only through a limited range, but sufficiently to materially affect regulation. As the voltage on the lamp drops, the current through the lamp drops also, reducing the temperature of the filament. The filament on cooling increases in resistance, and thus causes an even greater reduction in the current passing through it, which explains the fact that with a slight change in voltage there is a great change in the amount of light emitted by the lamp.

"The efficiency of the carbon lamp is low, but until the advent of the tungsten lamp, the efficiency of the carbon lamp was as good as could be obtained.

"The life of the carbon lamp is of a more or less indeterminate length, depending largely upon the definition of life. A carbon lamp will often continue burning for an indefinite period, during which the filament is undergoing changes which materially reduce the amount of light obtained from the lamp. Among other things, the carbon from the filament is gradually oxidized and deposited on the inside of the bulb in such a way as to cloud the glass and cut down the amount of light emitted to a considerable extent. After the carbon lamp has been in service from 1,000 to 1,500 hours, it has usually depreciated to such an extent as to warrant discarding.

"The Mazda lamp utilizes a tungsten filament, which does not vary in resistance with temperature changes to any such degree as does the carbon filament. In fact through a certain range of temperature, there is a slight increase in resistance with increase in temperature, consequently the light obtained from the lamp does not change as much with changes in voltage as is the case with the carbon lamp. This is a great advantage under variable voltage conditions, as the illumination of the car can be maintained more constant.

"The Mazda lamp is a more expensive article to buy than the carbon lamp, but the saving in current to be obtained may compensate for the increased cost of replacements. The life of the Mazda lamp is assumed to be 1,500 hours of burning, as after this point is reached the light produced drops below 80 per cent of normal, which value has been determined as the economical point to discard a lamp.

"There are two important reasons given for using reflectors in car lighting work, one of which is that by means of proper design a reflector can be made to hide the lamp filament from the eyes of passengers, and the other is that the efficiency of the lamp may be increased from 50 per cent to 100 per cent, depending upon the type of reflector used. Either reason by itself appears sufficient to warrant the use of reflectors, the main requirements of which are as follows in order of importance:

1. Hiding lamp filament.
2. Correct distribution of light
3. High efficiency.
4. Good appearance.
5. Economy.

"The principal types of reflectors are:

1. Prismatic clear glass.
2. Heavy density opal glass.
3. Medium density opal glass.
4. Light density opal glass.

"Prismatic clear glass reflectors are the most efficient, as with them it is possible to redirect the light in any direction desired, which permits of accurately meeting each lighting requirement. Their first cost is comparatively high, but is quite often justified where efficiency is of first consideration.

"Opal reflectors vary in efficiency, the heavy density being the most efficient and productive of the best light control.

"The following table shows the efficiency that may be expected from these various types of reflectors:

Table I—Efficiency of Various Types of Lighting Units.

Equipment	Foot candles per watt per sq. ft.	Watts per candle
Bare carbon lamp	0.44	3.75
Bare Mazda lamp	1.43	1.16
Light density opal reflector with Mazda lamp	2.22	....
Medium density opal reflector with Mazda lamp	2.60	....
Heavy density opal reflector with Mazda lamp	3.16	....
Prismatic clear reflector with Mazda lamp	3.20	...."

Electric Headlights for Southern Pacific Locomotives.

WITHIN a short time, all the locomotives in the freight and passenger service on the Pacific system of the Southern Pacific Company that have been equipped with gas headlights, will be operating under electric headlights either arc or incandescent.

The new incandescent lamp has a very powerful source of light, not more than three-sixteenths of an inch in diameter and is considered more efficient and satisfactory than the arc light. The energy consumed by this lamp is less than that consumed by two ordinary sixteen candle power lamps and yet when properly focused in the reflector, produces a cylinder of light of more than 700,000 beam candle power. When once focused the lamp stays in focus until burned out, its life being approximately three months.

Tests on several of the divisons show that with the locomotives running at high speed dark objects may be discerned at a distance of 1,800 to 2,000 feet away. The electric energy for the new headlight is derived from a storage battery mounted on top of the locomotive boiler. Charging stations are provided at the engine turning points where the batteries are removed and recharged.

The expenditure by the Southern Pacific for the new lights will total over $200,000. Electrical Engineer A. H. Babcock has supervised the installation.

The company's engineers are now developing the automobile type of electric generator to a size suitable for locomotive purposes. When this is accomplished there will be no further need for the battery charging stations.

Convention of Electrical Engineers.

THE seventh annual convention of the Association of Railway Electrical Engineers was held in Chicago the closing week of October. A report of unusual interest was that of the Committee on Data and Information, and covered the results of an effort to compile complete car lighting and other electrical statistics of the various roads of the country. The report showed that the total number of electric lighted cars increased from 11,017 in 1911 to 18,936 in 1914. The Committee found that the division of electric lighting units in railway service was as follows:

	Total No. Reported	Per Cent
a. c. Arc Lamps	9,600	21.0
d. c. Lamps	8,096	17.7
Magnetite Arc Lamps	1,429	3.1
Flaming Arc Lamps	1,252	2.3
500-watt Tungstens	734	1.6
400-watt Tungstens	1,576	3.5
250-watt Tungstens	11,205	24.7
150-watt Tungstens	9,030	19.8
Nitrogen Filled Tungstens	489	1.7
Cooper-Hewitt	1,516	3.3
Quartz Tube	55	.1
Nernst Lamps	570	1.2

The following interesting table shows the increase in car lighting equipment in the United States and Canada during the past three years according to the character of the equipment employed:

Total Number	1911	1912	1914	Increase in 3 Years
Electric Lighted Cars	11,017	13,115	18,936	71.8%
Cells Lead Battery	202,744	222,989	259,842	28.8%
Cells Nickel Iron	.....	4,855	31,883	.....
Straight Storage Cars	1,372	2,078	2,707	97.1%
Headened Generator Sets	192	291	273	42.2%
Axle Generator Cars—60 and 30 Volt	5,900	7,198	12,458	111.5%

The Committee on Electric Headlights reported in part, as follows:

"During the last two years more locomotive headlights have been installed than in all the previous years of electric headlights. Most of these equipments were installed in compliance with the laws of various states. As the interpretation of these laws has caused quite a difference of opinion, it was only natural that the installations were not made until near the expiration of the time set by the law. This resulted in the equipment being installed in a somewhat haphazard manner, by inexperienced men, and lack of uniform methods."

The point referred to in the foregoing quotation, the uncertainty and ambiguity of the state laws upon the subject, was one around which a good part of the discussion which ensued revolved; although by the nature of the case, nothing conclusive could be agreed upon.

One of the most interesting features of the convention was the reading of a paper on: "The Wireless Telegraph and the Wireless Telephone as an Adjunct in the Operation of a Railroad," by Dr. Frederick H. Millener, describing in a general way the experiments which he has been conducting for seven years past under the direction of the Union Pacific. These were directed, in the first instance, toward the perfecting of a system of cab signaling; during the course of which work an industrial truck which attracted a good deal of attention throughout the country was propelled by storage battery about the shop yards at Omaha, actuated and controlled by wireless signals from a nearby station. Following this, Dr. Millener's work has in view the installation of a system of wireless telegraph, with stations at North Platte, Neb., and Green River and Cheyenne, Wyo. The wireless telegraph system was perfected some three years ago and has been ready to be installed; although as Dr. Millener says, "for various reasons, not connected with the wireless, it has been postponed." The most recent work of Dr. Millener has been directed toward a system of wireless telephony, and this apparatus is now stated to be beyond the experimental stage. It comprises now, in the one outfit, an intercommunicating telephone from car to car in the same train, long distance telephone by wire when the train is stopped at a station; and when the train is in motion between stations a wireless telephone affording communication with the train ahead, the train behind or the station.

The conclusions of the committee relative to the economics of electric traction, were as follows:

"Various reasons for the electrification of portions of steam railroad have been given and in many cases the necessities of the situation governed the decision. As an alternative to double-tracking, tunnel enlargement, grade reductions, increase in terminal space, or other large expenditures required either by traffic conditions or legislative enactment, electrification will usually show an economic saving. That is, the recognized decrease in maintenance and repair cost of electric locomotive equipment, saving in crew wages, and reduction in cost of power will more than counterbalance the additional operating cost of electric transmission and distributing systems. In these cases the first cost of electrification is offset by the saving in not making the other improvement. In this connection it should be borne in mind that the first cost of electric locomotives—which will amount to about one-third of the total cost of an electrification including power plant—should not be treated wholly as an electrification investment, because they can usually be considered as a normal addition to the motive power equipment of the road. In any case there should be credited against the cost of the locomotives the cost of equivalent steam locomotives which do the same work, assuming that the railroad is large enough to absorb the steam locomotives displaced.

"The cost of handling freight trains can usually be reduced by the higher schedule speed obtainable due to the overload characteristics and high tractive effort at low speeds of electric locomotives on grades, and the larger train units which can be operated, thus reducing the number of trains for a given traffic. It is also a fact that electric locomotives can make from 50 per cent to 100 per cent more mileage per year than steam locomotives due to facility of operation, less round house time and fewer major repairs.

"Railroad electrification for straight economy over steam operation, where there are no contingent improvements saved which can be credited to cost of electrification, will not usually show sufficient net saving in expenses to provide for interest on the investment and amortization. Of course all conditions must be taken into account and a detailed study made in any particular case to arrive at a final answer as to the economies. For instance, as a power plant represents about one-third the cost of an electrification, the purchase of power may affect the result and an unusually cheap power supply, such as may be obtained from hydro-electric developments in certain localities, will often make electrification prove economical.

"Generally speaking, the savings in operation due to electrification of a steam railroad result from two principal causes; first, that due to reduction in fuel consumption, locomotive maintenance and repairs, engine house expenses and other detail costs; and second, that due to reduction in number of freight trains to handle a given traffic.

"The reduction in the amount of coal hauled for locomotive purposes, where a steam plant is substituted, would materially affect the traffic operation. This hauling of coal would be entirely eliminated where power was purchased or generated in hydro-electro plants.

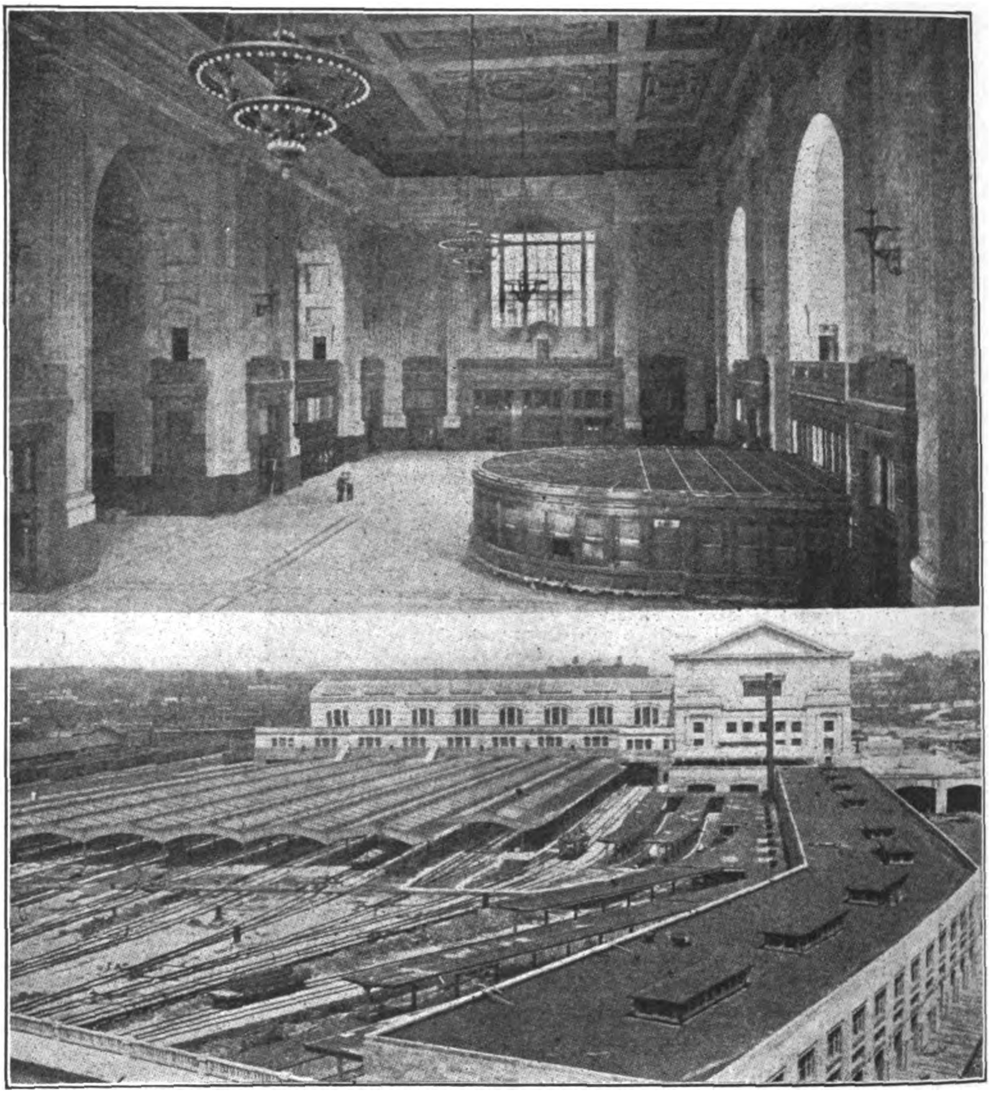
"Electric operation of passenger trains provides cleaner and faster service which is attractive to the public and results in greater traffic, increasing the gross earnings."

Terminal Improvements

Completion of the New Kansas City Union Passenger Station.

THE new Union Passenger Station at Kansas City, Mo., opened for traffic on November first, and constitutes one of the finest railway terminals in the world. The project was fully described in the RAILWAY WORLD of April, 1913, when its construction was well under way, although far from completion. The investment amounts to fully $40,000,000 and provides in addition to a modern and beautiful passenger station for all roads entering the city, a belt line for all such roads, the separation of all grades, two new freight yards for the interchange of traffic, four local freight houses and one new team track yard. Work on the project which has consumed four years, is now all practically completed with the exception of a double track bridge across the Kaw River and an 8,000-foot double-track steel viaduct which, when completed will provide a direct entrance to the station for the four roads entering from Kansas City, Kansas.

The station building itself, which cost $6,000,000 and is constructed of steel, stone and concrete, is a remarkable example of architectural beauty combined with railway efficiency. As the accompanying floor plan indicates, it is built in the shape of a "T," the head house, which faces a plaza being 510 feet long by 143 feet wide and six stories high. The stem of the "T" is 410

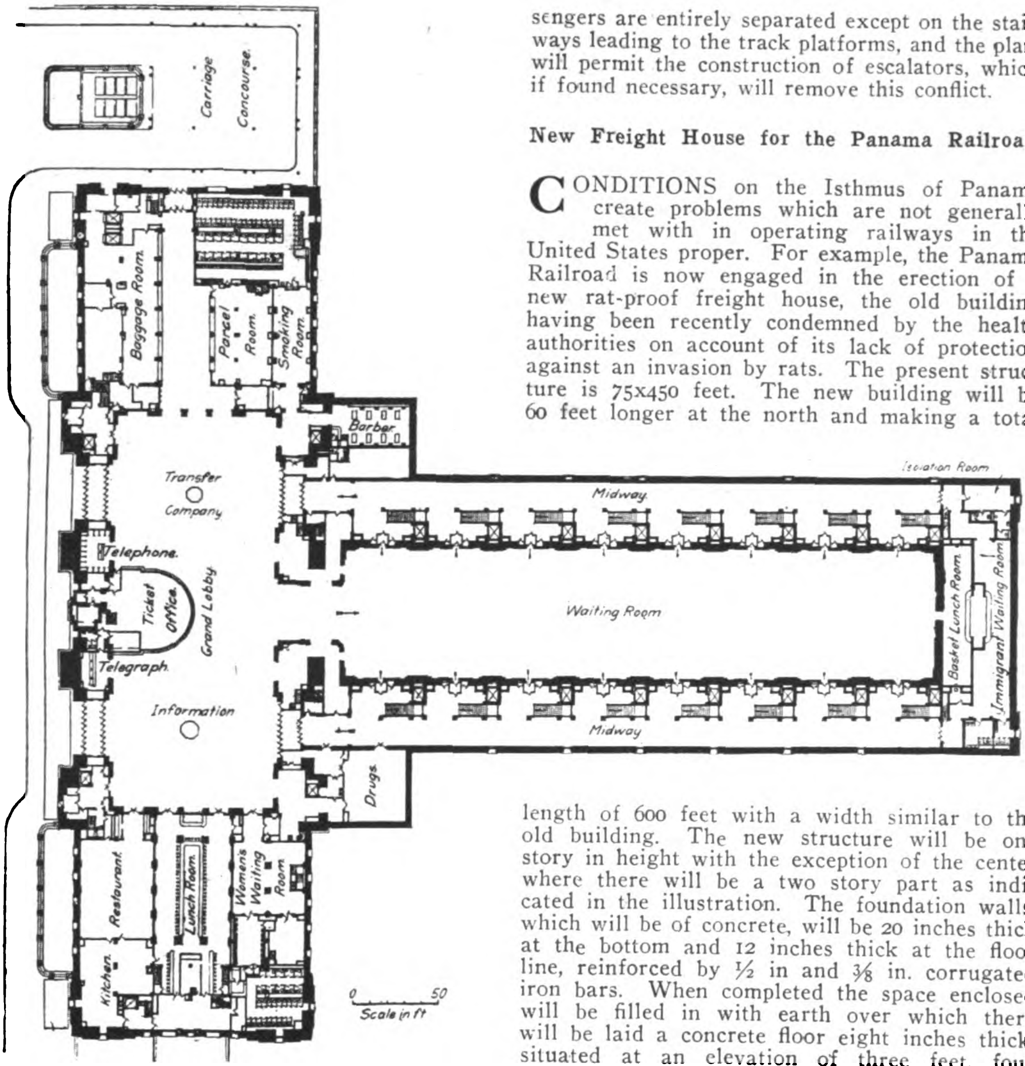


Two Views of the New Kansas City Union Passenger Station. The First Showing the Grand Lobby and the Second, the Rear of the Station with its Numerous Modern Train Sheds.

feet long by 165 feet wide and extends out over the tracks. The second stories of the wings of the building are devoted to offices for the terminal company and various roads. The grand lobby which has been kept entirely free from seats is 242 feet by 103 feet in area and 92 feet high. It is finished in Kasota and Sagiola marble and trimmed with Great Bend, Tenn., brown marble. Three great chandeliers together with eight groups of side wall lights are employed for illuminating purposes. On the south side of the lobby is a semi-circular ticket office with nineteen railroad and four Pullman ticket windows. Signs over the windows are illuminated automatically as the windows are opened. The ticket stock room is directly below the ticket office and connected with it by a spiral stairway, while the terminal ticket auditors are located on a mezzanine floor directly above the rear of the ticket office.

Immediately adjacent to the ticket office on the east is the telegraph office, while on the opposite side are placed the telephone booths. An octagonal information bureau is located in the center of the east end lobby, while a similar booth is provided for the transfer company in the west end. A bulletin of trains is installed in front of the station master's office on the mezzanine floor just to the left of the waiting room, on which the information is presented by means of small metallic letters placed in slots according to a system devised by the Commercial Sign Company, Ashtabula, Ohio. No train announcing system will be installed at present and all trains will be called by ushers.

Directly opposite the ticket office and opening from the grand lobby is the general waiting room, 352 feet long by 78 feet wide. This area is given up largely to seats, having 44 double mahogany seats with a capacity of 750 persons. This room is finished in terra cotta with a base of Great Bend marble and a paneled plaster ceiling. Na-



Floor Plan of the New Union Station at Kansas City.

tural illumination is provided by large triple windows over each train gate while large light clusters are placed along each side wall.

On each side of this room are eight train gates, directly back of which is an exterior concourse are stairways leading to the platforms below. Each gate is equipped with two National train indicators. In this way the passengers are enabled to remain seated in the waiting room until their trains are ready and by collecting in those seats adjacent to the train gates through which they must pass, they are advised at once when their trains are ready without the necessity of standing about the gate.

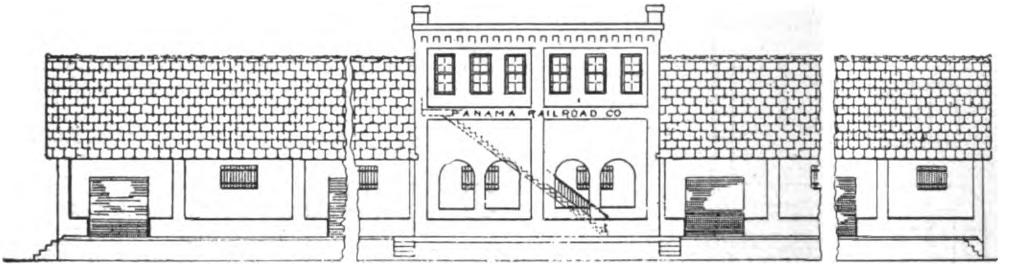
The concourse on each side of the train gate is also used as an exit from trains by incoming passengers, who, however, do not pass through the main waiting room, but directly into the grand lobby through doors opposite the main entrance. In this way incoming and outgoing passengers are entirely separated except on the stairways leading to the track platforms, and the plans will permit the construction of escalators, which, if found necessary, will remove this conflict.

New Freight House for the Panama Railroad.

CONDITIONS on the Isthmus of Panama create problems which are not generally met with in operating railways in the United States proper. For example, the Panama Railroad is now engaged in the erection of a new rat-proof freight house, the old building having been recently condemned by the health authorities on account of its lack of protection against an invasion by rats. The present structure is 75x450 feet. The new building will be 60 feet longer at the north and making a total length of 600 feet with a width similar to the old building. The new structure will be one story in height with the exception of the center where there will be a two story part as indicated in the illustration. The foundation walls, which will be of concrete, will be 20 inches thick at the bottom and 12 inches thick at the floor line, reinforced by ½ in and ⅜ in. corrugated iron bars. When completed the space enclosed will be filled in with earth over which there will be laid a concrete floor eight inches thick, situated at an elevation of three feet, four inches above the street level. The main outside walls will be 11 inches thick rising to a height of 16 feet from the floor.

The roof will be supported by iron trusses, spaced on 20-foot centres, with the top and bottom members of ⅜ by 3½ by 6-inch material, and the other truss members of ⅜ by 2 by 2½-inch material. There will be 28 roof trusses in the building. Where the walls separate the two-story part from the shed, purlins will extend from the trusses and be embedded in the wall concrete. The roof covering of the shed will consist of red colored tile from the Paraiso stock pile, the same as used on the Balboa shop buildings.

The floor plan of the shed provided for a depressed track extending practically its entire length. It will be 12 feet wide, with top of rail four feet below floor level, and will be located 42 feet from the street side and 21 feet from the rear. The shed space will be entirely devoted to freight storage, with the exception of two toilets, one for the gold and the other for silver employes. The front of the 2-story part on the lower floor will be partitioned off into two



FRONT ELEVATION OF PANAMA RAILROAD'S NEW FREIGHT HOUSE.

rooms, each 18½ by 23 feet in plan, one a specie room, and the other a storage room for small freight parcels. Back of these rooms will be a truckway, which will allow communication through the 2-story part from one section of the shed to the other. The side and end walls will be pierced at regular intervals by iron barred windows, while door openings, 10 by 10 feet in size, will be spaced at every 40 feet along the front or street side.

The 2-story part will have a battlemented front, and will be enclosed by fire walls fifteen inches thick, with a reinforced concrete floor and roof. The roof will be nearly flat and will be covered with tar and gravel in accordance with Barrett specifications. The second floor will be partitioned off with 7-foot frame partitions to meet the requirements of the freight agent and his office force. The front wall of the 2-story part will extend out over the 8-foot platform which will be built along the front of the shed. This wall will be pierced by four arched openings each five feet six inches wide by eight feet four inches high at the top of the arch, and at the top, will be surmounted by a 2-foot parapet with turreted corners. Access to the upper floor will be provided by two stairways, one on the outside platform, and the other on the inside of the building. The estimated cost of the freight house is $72,000.

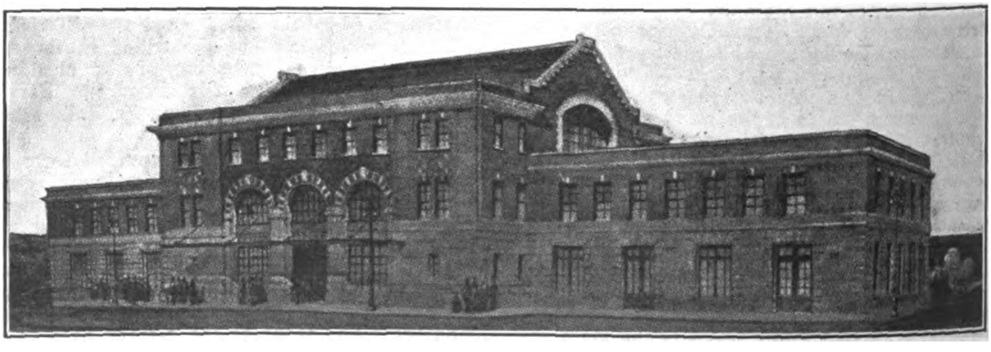
Oregon Short Line's New Passenger Station at Pocatello, Idaho.

THE Oregon Short Line is to construct a new passenger station at Pocatello, Idaho, the general appearance of which is indicated in the accompanying illustration. The main portion of the building will be three stories high and occupy an area 77x89 feet. The wings will each be 60x68 feet and the entire building will be fire-proof construction throughout, the roof being shingled in asbestos. Gray stone and dark red brick are the construction materials employed.

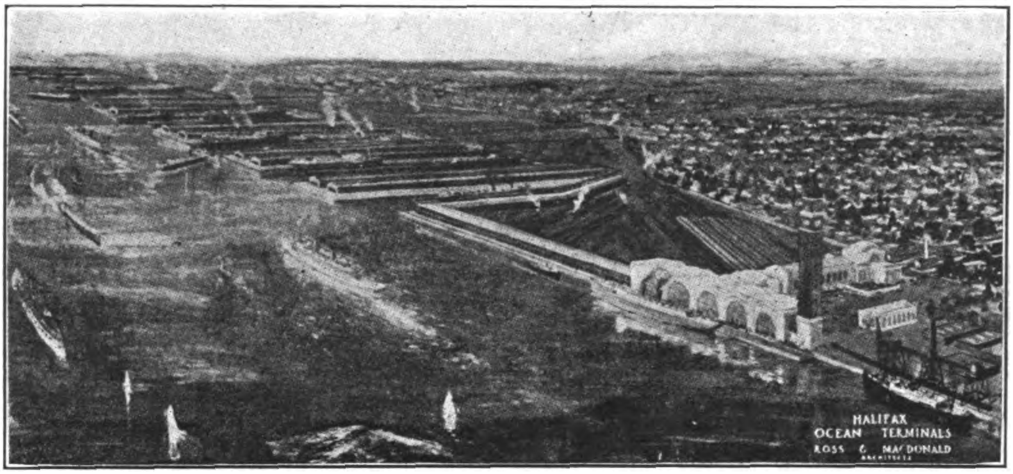
The first floor has been planned to contain the usual facilities for the accommodation of passengers and for the handling of baggage and express. The general waiting room will be 41x89 feet, with a balcony entirely around it on the second floor. The left wing of the first floor is to be employed for a lunch room on the track side and a dining room, pantry and kitchen on the street side. In the right wing will be located an immigrants' waiting room, the mail clerks' office and the baggage room, which will be 30 feet wide by 60 feet long. At the extreme end of the wing will also be found an express room and express office. The floors will be of tile in the main waiting rooms and dining room and all cement in other portions of the first floor. The second floor will be entirely devoted to the railroad company's offices.

Ocean Terminals at Halifax, N. S.

PRELIMINARY plans have been submitted to the Intercolonial Railway for new ocean terminals at Halifax, N. S., which indicate that when complete they will be among the finest and most comprehensive in the world. The accompanying photograph gives a general view of the proposed terminals which are to be equipped for the handling of both passengers and freight and the transference of passengers, baggage, mail and express to and from railway trains and steamships. Local Halifax city traffic is also to be accommodated. The general scheme, as outlined in a recent issue of the "Canadian Railway and Marine World" consists of a passenger station built in the shape of a large letter "T," not unlike the new Union Station at Kansas City



GENERAL APPEARANCE OF THE PROPOSED NEW STATION OF THE OREGON SHORT LINE AT POCATELLO, IDAHO.



ARCHITECT'S DRAWING OF THE PROPOSED NEW OCEAN TERMINALS AT HALIFAX.

referred to elsewhere, the foot of the "T" being at the shore end and the head of the "T" at the steamship landing stage. The shore end of the building will provide accommodations for the local Halifax traffic and will contain ticket offices, baggage and parcel checking rooms, restaurant, retiring rooms, etc. The upper floors of the building will be employed for the offices of the railway and steamship lines.

The general plan provides a landing stage approximately 2,000 feet long, which will be divided into two parts, the northerly third for the active handling of passengers, baggage, mail and express and the remainder for the handling of cargo. It is upon the northerly end of the landing stage that the top portion of the "T" shaped building is placed. Passengers disembarking from steamships will enter the building at the second story level.

New Engine Terminal Facilities for Southern Railway at East St. Louis.

NEW engine terminal facilities for Southern Railway at Denverside, near East St. Louis, Ill., will be provided at once at a cost of approximately $273,000. The new terminal will include an 18 stall round house, 90-foot turn table, modern coal and cinder handling plant, new machine shop and additional machinery, wash room, store room, oil house and office building. Complete arrangements will also be made for water supply, fire protection, drainage, and lighting. An important part of the work will be the construction of repair yard tracks and other track work.

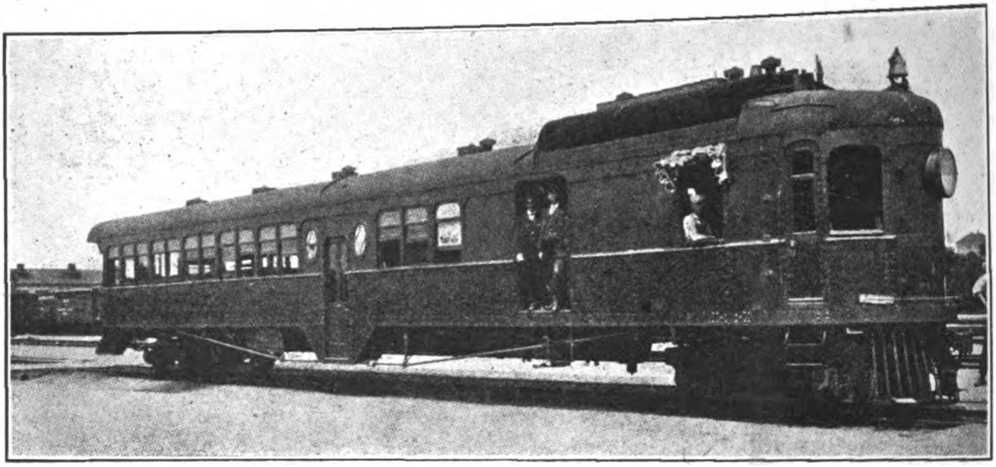
Grading necessary for the tracks is now under way and bids have been invited for the construction of the round house, shop and other buildings. It is intended to have the new facilities completed and the entire plant in use by the early part of the coming summer so as to be fully prepared for the succeeding fall business.

Construction of Terminal Facilities by Grand Trunk Pacific Railway.—The Grand Trunk Pacific Railway has let contracts to the value of $300,000 for terminals in British Columbia. This work comprises the erection of divisional point facilities at Endako, Smithers, Prince George and Pacific, and will include round houses, machine shops and other railway buildings. Preparations are also being made for oil storage buildings along the line, as it is understood that oil burning locomotives are to be used in the fast transcontinental services of the company.

Interstate Commerce Commission

Head-on Collision Between Gasoline Motor Car and Passenger Train.

THE Commission, through its division of safety, has issued a report on the head-on collision which occurred on the Kansas City Southern Railway near Tipton Ford, Mo., on August 5, 1914. This collision resulted in the death of thirty-eight passengers and five employes and the injury of thirty-four passengers and four employes. The motor car which was of light steel construction 70 feet long and weighed 74 tons, was totally destroyed. The passenger train, which consisted of four mail and express cars, one day coach, one chair car and one Pullman sleeping car, besides the locomotive, was running at the time of the collision, at about thirty-five miles per hour. The motor car was running at about the same speed. The accident, which occurred on a tangent 550 feet in length, was apparently the result of a confusion of train orders, the direct cause being the failure of the motor car to wait at Tipton Ford for train coming in opposite direction, as directed by order issued by operator on duty at Joplin to Conductor Nicholas, of the motor car. As the entire crew of the motor car, including Conductor Nicholas, were killed in the collision and their bodies cremated, no evidence was procurable as to the reason why the instruction contained in Order No. 84 was not obeyed by them. In commenting on the accident the Commission's report states:



VIEW OF MOTOR CAR TAKEN SOME TIME PRIOR TO ACCIDENT.

"This is the first accident investigated by the Commission wherein a gasoline motor car was involved. On account of the fire caused by ignition of this highly inflammable substance, the casualty list in this accident was much larger than it otherwise would have been. The rapidly increasing use of these motor cars, carrying large quantities of gasoline, introduces such an additional element of danger as to demand extraordinary precautions against the possibility of collisions wherever such cars are used.

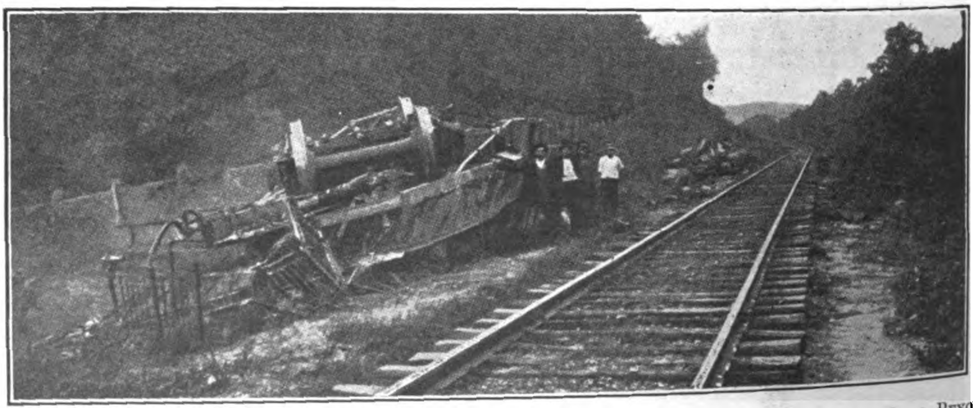
"As previously noted, no block signal system is in use on the Kansas City Southern Railway. It appears also from the facts developed in this investigation that even the inherently weak train-order system is not used at its highest degree of efficiency on this railroad. Rule No. 208 of the Kansas City Southern Railway book of rules provides for the placing of a meet order at the designated meeting point "when practicable." It was obviously not practicable to use the middle order in this case, for the reason that no operator was stationed at Tipton Ford.

"The 20 miles of track between Joplin and Neosho is used jointly by trains of the Kansas City Southern and Missouri and North Arkansas Railroads. Four first class and two third class trains of the latter road are scheduled to pass over this section of track daily, subject to the operating rules of the Kansas City Southern Railway. There are two passing tracks between Joplin and Neosho and it must frequently become necessary to require trains to meet at those points; yet no operator is employed at either place, and it is thus rendered impossible to use the middle order at meeting points on this section of track."

Reduction in Express Company Earnings.

THE Commission has issued a report which shows a great reduction in the annual income of express companies for the year ending June 30, 1914. The operating loss of the Adams was reported to be $259,284 for the month of June and $965,385 for the year. The operating loss of the American was $50,659 for the month and $644,769 for the year. The operating income of the Globe was $2,182 for the month, whereas it reported an operating loss of $27,242 for the year. The United States reported an operating loss of $214,340 for the month and an operating loss of $572,906 for the year. The Western Express reported an operating income of $1,134 for the month and an operating loss of $38,904 for the year.

The Great Northern reported an operating income of $193,182 for the year, a decrease of over $64.000 in comparison with last year. The



APPEARANCE OF CAR AFTER HEAD-ON COLLISION. THE CURVE IN THE BACK-GROUND IS JUST BEYOND THE POINT OF ACCIDENT.

Northern Express reported an operating income of $263,615, a decrease of nearly $40,000. The Southern reported an operating income of $890,773 for the year, a decrease of over $280,000. The Wells Fargo reported an operating income of $104,256 for the year, a decrease of over $614,000.

Combining the reports of all the express companies, it was shown that they suffered an operating loss of $287,685 for the month of June, and enjoyed an operating income of but $404,529 for the year, a decrease for the year of over $4,000,000.

Ruling on Passenger Fare Refund.

IN a recent decision, the Commission has ruled that a passenger may not leave a train at any point he chooses and then recover from the railroad on the whole of the unused portion of a through ticket he purchased. T. C. Kennedy, of Chicago, bought a ticket from New York to Chicago on the New York Central. He left the train at Syracuse and tried to collect the fare from Syracuse to Chicago. The Commission decided a refund should be made from Elkhart, Ind., the first stop for which a ticket can be purchased, and reparation from Elkhart to Chicago was awarded.

Commission Petitioned for Relief Under the Panama Canal Act.

THE Commission has announced further hearings upon the applications of railroads under the Panama Canal Act for permission to continue their ownership and operation of certain water lines.

The individual petitions to be heard will include the ownership and operation of the Chesapeake Bay lines by the Pennsylvania, Baltimore, Chesapeake & Atlantic and the Maryland, Delaware and Virginia railroads; the ownership and operation of the Chesapeake Steamship Company by the Southern and the Atlantic Coast Line; the ownership and operation of the Baltimore Steam Packet Company by the Seaboard Air Line Railroad and the ownership and operation of the Old Dominion Steamship Company and the Virginia Navigation Company by the Norfolk & Western, Chesapeake & Ohio, Atlantic Coast Line, the Seaboard Air Line and the Southern railroads.

The hearing on the petitions of other railroads which own and operate water lines on the Great Lakes have been concluded. It is understood that the Commission is now drafting some opinions setting forth whether the rail lines shall or shall not be permitted to operate Lake lines.

Passenger Fare Increase on Baltimore and Ohio.

THE Commission has granted authority to the Baltimore and Ohio Railroad and the Central Railroad of New Jersey to charge a higher rate for through passenger tickets from New York City to the West that the aggregate of the intermediate fares to certain designated points. The through fares, in any event, are not to exceed those established by the Pennsylvania Railroad to and from the same points. The fares, thus adjusted, will be on a basis of 2½ cents a mile. The through rate from New York to Chicago was recently increased; the new rates authorized are to make intermediate fares conform to that basis.

Ruling on Salmon Rates from Pacific Coast.

PERMISSION has been granted to transcontinental railroads by the Commission to charge rates on canned salmon from Pacific Coast shipping points to Eastern destinations without regard to the limitations placed on these rates by the long-and-short haul section of the Interstate Commerce Act.

This permission applies to shipments from the Western points of origin on canned salmon and canned shad in carloads, minimum weight 70,000 pounds, to destinations in territories designated as Groups B, C, D and E.

Pennsylvania Railroad Increases Passenger Rates.

A GENERAL increase in long distance and suburban passenger rates has been announced by the Pennsylvania Railroad to become effective December 15th. The Philadelphia and Reading has also announced that it would make increases similar to those of the Pennsylvania. In making the announcement, the Pennsylvania Railroad made public the following statement:

"As the Commerce Commission has declared it to be a matter of public policy that each branch of the railroad service should contribute its proper share to the cost of operation and of return upon the property devoted to the use of the public, the road has resolved upon readjustments in passenger rates."

"The policy of the company," the statement adds, "is to embody the policy established by the Commission and so spread the changes in fares that the burden will fall but lightly on any single traveler."

Rate Readjustments from St. Louis and Ohio River Crossings.

FREIGHT rates throughout what is known as "southeastern territory"—east of the Mississippi and south of the Potomac and Ohio Rivers—have been generally readjusted by a decision of the Commission. The decision, supplemental to one announced several months ago concerning operation of the long and short haul law, with respect to class and commodity rates from all sections of the country to destinations in the south Atlantic and Gulf States, authorized the carriers in most instances, under specified restrictions, to continue existing class and commodity rates which, in most instances, are higher to intermediate points than to the more distant points.

Rates, on both class and commodity freight, from New York and the East generally, from St. Louis and Chicago and from all Ohio River crossings, including Louisville and Cincinnati, to and from points in the South Atlantic and Gulf States, are affected. In most instances existing rates are authorized, in which there are technical violations of the long and short haul provisions, but in five specific instances the Commission declined to grant higher rates from the Northern and Eastern points to intermediate destinations than to the more distant points. The decision is effective April 1, 1915.

Higher Passenger Rates Filed.

ACTING on the suggestion of the Commission in the recent five per cent rate increase hearing, the railroads operating east of the Mississippi and west of Pittsburgh and Buffalo, have filed schedules, raising interstate passenger rates almost uniformly at a 2½-cent level, effective December 1st.

It is estimated that if the new schedules are approved the railroads immediately involved will be able to add $1,000,000 to their yearly income.

The new rate between Chicago and Cincinnati will be $7 as compared with $6, the standard rate between Chicago and Cleveland $8.55 instead of $7.75, between Chicago and St. Louis $7.50 instead of $5.80, standard rate between Chicago and Buffalo $13.10 instead of $12. Higher fares between points in trunk line and central passenger territories will be filed in the near future, the rate between New York and Chicago to be probably $21.10 instead of $20.

Trunk Line Switching Allowance at St. Louis Reduced.

THE Commission has issued a supplemental decision in the case of the Manufacturers' Railway of St. Louis, directing the trunk lines to cancel out their allowances of $4.50 per car to the Manufacturers' Railway and to fix an allowance for the future not to exceed $2.50 per car. The Commission, however, refused to sanction, by affirmation or otherwise the establishment of through rates between the trunk lines and the St. Louis Switching Railway.

It was noted in the decision of the Commission:

"If the trunk lines elect voluntarily to participate in the establishment and maintenance of through rates, the division thereof which they may lawfully pay to the Manufacturers' Railway may not, in view of the common ownership of a majority of the stock of that carrier and of the Anhouser-Busch Brewing Association, its largest shipper, be more than is just and reasonable for its service.

"There must in any view taken of this case be some point of which the fact of this common ownership of stock becomes importantly significant, and immediately beyond the limit of reasonableness allowances, divisions or concessions of any kind whatsoever granted by the trunk lines to the Manufacturers' Railway comes, in the Commission's view, that point. In all other respects this carrier is in this case treated by the Commission just as any other terminal common carrier that does not serve a mutually owned industry shipper would be."

Industrial Railway Decision Reversed.

IN a supplemental decision in the industrial railway case issued on November 6th, the Commission directs trunk line railroads to re-establish allowances or divisions with United States Steel Corporation railways which are concededly common carriers. Tens of thousands of dollars annually will accrue to the industrial lines through the decision.

In its conclusions the Commission said:

"We shall expect the trunk line roads, under the modification here made of our original findings, to re-establish allowances, divisions or demurrage or per diem arrangements with the industrial roads only in instances in which the transaction is bona fide and in which it is clearly lawful and proper. Each case must be judged by its own facts and merits."

The Commission modified its original findings on account of the decision of the Supreme Court in the tap line cases.

"We have concluded," the Commission says, "that it is our duty to refrain from issuing an order and to avoid the delay which would be attendant upon litigation.

"What we have said relative to establishment of allowances or divisions with the industrial roads referred to is not to be understood as a finding by us that those industrial roads can resume these relations with the trunk line carriers without transgressing the provisions of the commodities clause. If infractions of that law come to our notice, we shall in the proper way bring them to the attention of the Department of Justice."

Chairman Harlan, who prepared the original decision in the industrial railways case, dissented from the findings of Commissioner Clark and the majority in to-day's decision. He holds, in effect, that the iron and steel railways are purely plant facilities and that any allowances or divisions of rates granted to them by the trunk lines are in the nature of rebates from the regular rates. He maintains that the privileges and advantages of allowances or divisions were being enjoyed by a relatively small number of extensive industrial establishments and that they ought "either to be held to be an unlawful concession by the carriers to such shippers, or, if found to be lawful, the principles upon which they might be justified ought to be clearly defined by the Commission so that like privileges and advantages might be claimed, as of right, by all industrial establishments served by the land carriers in question, whether they be large or small."

Chairman Harlan holds that an order should be entered on the basis of the original report, so that the whole matter might be judicially reviewed and some definite principle established by which all similar cases could be disposed of.

LEGISLATION

The Passage of the Clayton Bill.—The Clayton bill, to supplement the anti-trust laws, which has been under discussion in Congress for many months, became a law October 15. As adopted it consists of 26 sections; and it deals chiefly with "commerce" which word, in the Act, is used to mean interstate and foreign commerce, substantially as defined in the interstate commerce law. This law deals with carriers specifically only in sections 7, 9 and 10.

Section 7 forbids one corporation to acquire stock of another, if such acquisition will restrain commerce or lessen competition; but with certain provisos; and one of these provisos is that Section 7 shall not prohibit common carriers from aiding or buying branch lines or beeders where competition is not lessened by such action.

Section 9 makes it a felony for an officer of a common carrier to wilfully misapply funds; maximum penalty, ten years' imprisonment and a fine limited only by the discretion of the court.

Section 10 is designed to forbid collusive contracts for supplies. This section goes into effect October 16, 1916, and reads as follows:

Section 10. That after two years from the approval of this Act no common carrier engaged in commerce shall have any dealings in securities, supplies or other articles of commerce, or shall make or have any contracts for construction or maintenance of any kind, to the amount of more than $50,000, in the aggregate, in any one year, with another corporation, firm, partnership or association when the said common carrier shall have upon its board of directors or as its president, manager or as its purchasing or selling officer, or agent in the particular transaction, any person who is at the same time a director, manager, or purchasing or selling officer of, or who has any substantial interest in, such other corporation, firm, partnership or association, unless and except such purchases shall be made from, or such dealings shall be with, the bidder whose bid is the most favorable to such common carrier, to be ascertained by competitive bidding under regulations to be prescribed by rule or otherwise by the Interstate Commerce Commission. No bid shall be received unless the name and address of the bidder or the names and addresses of the officers, directors and general managers thereof, if the bidder be a corporation, or of the members, if it be a partnership or firm, be given with the bid.

Any person who shall, directly or indirectly, do or attempt to do anything to prevent anyone from bidding or shall do any act to prevent free and fair competition among the bidders or those desiring to bid shall be punished as prescribed in this section in the case of an officer or director.

Every such common carrier having any such transactions or making any such purchases shall within thirty days after making the same file with the Interstate Commerce Commission a full and detailed statement of the transaction showing the manner of the competitive bidding, who were the bidders, and the names and addresses of the directors and officers of the corporations and the members of the firm or partnership bidding; and whenever the said Commission shall, after investigation or hearing, have reason to believe that the law has been violated in and about the said purchases or transactions it shall transmit all papers and documents and its own views or findings regarding the transaction to the attorney general.

If any common carrier shall violate this section it shall be fined not exceeding $25,000; and every such director, agent, manager or officer thereof who shall have knowingly voted for or directed the act constituting such violation or who shall have aided or abetted in such violation shall be deemed guilty of a misdemeanor and shall be fined not exceeding $5,000, or confined in jail not exceeding one year, or both, in the discretion of the court.

Missouri Full Crew Law Defeated.—As briefly referred to editorially, the people of Missouri have repudiated the State Full Crew Law. Complete official figures show the majority given against the bill to be three times as great as the estimate based on early returns. There were 324,085 votes against and 159,593 in favor, a majority of 164,492 in opposition to the bill, making the vote more than two to one against it. Outside of the three principal cities, St. Louis, Kansas City and St. Joseph, the measure received only 86,660 votes in the State and was beaten by a ratio of about three to one. The farmers in every section voted almost solidly against it.

The city of St. Louis, in which the Brotherhood of Trainmen looked for a big majority for their bill, went against it by 18,417 votes. In Kansas City, where it was aided by a local political fight and in St. Joseph, where its friends made an especially vigorous campaign, it carried.

Especial interest was attached to the election all over the United States, as it was the first time any regulation affecting railroads was submitted to a vote of the people. W. G. Lee, of Cleveland, Ohio, national head of the Brotherhood of Trainmen, came to Missouri and personally conducted the campaign for his organization. The Missouri statutes prevented the roads making an active campaign, whereas the members of the Trainmen's Union were free to work as they saw fit in behalf of the measure and spent vast sums of money. The majority cast against the bill is one of the greatest in the history of Missouri, and is far bigger than the State has ever given any candidate for office.

After the Legislature passed the measure, the railroads, under the referendum, brought it before the people for a vote. Railroad officials are jubilant over the result and declare it a striking and uncontrovertible evidence that the farmers and people of the State generally are now in sympathy with the transportation companies and in favor of giving them fair play, and that railroad baiting has ceased to be popular.

Report of Special Committee on Relations of Railway Operation to Legislation.—On November 3rd, the Special Committee on Relations of Railway Operation to Legislation, issued a report outlining the general work of this Committee since the last general report of May 4, 1914. Railroads representing 227,141 miles of lines are now supporting the work of this Committee which includes the following sub-committees: Officers of the Mechanical Departments; Engineering Officers and Signal Officers. The following is a resume of the report:

In report No. 12, allusion was made to the proposition to increase largely the discretionary power of the Interstate Commerce Commission. As a result of hearings on individual bills relating to various specific items of railway operation, practically all the subjects pending before the House Committee on Interstate and Foreign Commerce have been combined in a single bill giving the Interstate Commerce Commission authority to require the installation, under certain conditions, of block signal systems, automatic train stops, and steel passenger equipment, and authorizing the Commission to designate the type of headlights to be used, and to investigate the roadbed, track, equipment and facilities used by common carriers, and to direct changes, improvements and repairs to be made in them. This bill has not yet been reported out of committee, but it is probable that this is the form which any legislation on this subject will take. Your Committee has obtained the views of a very large number of operating officers on this bill, and is prepared to present the conclusions of the railways on the subject when opportunity offers.

With a view to ascertaining the extent of the financial burden placed upon the railways by legislation affecting railway operation, your Committee issued Circular No. 64, asking for such figures as could be furnished.

A number of roads have been unable to furnish them, and your Committee recommends that, hereafter at least, such separation of accounts be made as to enable each road to know definitely the precise amount which it is obliged to pay out by reason of legislation such as that above referred to.

Since the last report no bill has passed both houses of Congress.

A bill changing the penalty clause in the Hours of Service Act has passed the House of Representatives, and is pending in the Senate. If this becomes law, the penalty for violation of that act will not be less than $100 nor more than $500, instead of not more than $500, as at present.

In Report No. 12, you were notified that the Chief Inspector of Locomotive Boilers had asked for a conference preliminary to setting a factor of safety for locomotive boilers in service or under construction prior to January 1, 1912, and that the railways were represented at this conference on April 28, 1914, by the Sub-Committee of Mechanical Officers. An agreement was reached between the Sub-Committee, the Government officials, and the employes, on this subject. This agreement was approved by the Interstate Commerce Commission after hearing, and the necessary changes in the rules were promulgated by the Commission on June 9, 1914.

A bill is pending in Congress and has been reported to the House of Representatives, extending the jurisdiction of the Bureau of Locomotive Boiler Inspection over all parts of the locomotive. Witnesses for the railways appeared before the House Committee on Interstate and Foreign Commerce in opposition to this bill, and in case an opportunity is offered similar action will be taken before the Senate committee having it in charge.

In April, 1914, a tentative preliminary report of a committee of the American Society of Mechanical Engineers, was given wide circulation containing a proposed code for the construction, maintenance and inspection of stationary boilers, and a proposed typical act enforcing such code to be recommended for passage by the various state legislatures.

In view of the inclusion in that report of a number of requirements which were not in harmony with the experience of mechanical officers of the railways, an opportunity was sought and obtained to discuss the matter with the responsible officers of the American Society of Mechanical Engineers.

In consequence of these representations it is thought that the code in question will be materially modified in the final report which will probably be made to that Society in December, next.

Your Committee, however, has not felt that it should give even tentative approval to any proposed legislation on this subject, inasmuch as the railways ought to have the largest liberty of action in dealing with this question, in view of the great disparity in local conditions; nor does it feel that in dealing with the proposed code of rules it should do more than call the attention of the American Society of Mechanical Engineers to such points as in its judgment are objectionable.

On June 1, 1914, Bulletin No. 60 was issued, bringing the information as to the progress of construction of steel and steel underframe passenger equipment up to January 1, 1914.

The number of steel and steel underframe passenger equipment cars constructed in the United States in the calendar year 1914, was 3,129, bringing the total number of these cars in existence to approximately 14,000. This latter figure compares with 1,302 such cars in service January 1, 1909.

In view of the apparent demand, your Committee issued on July 11, 1914, Bulletin No. 63, revising and superseding Bulletins Nos. 22 and 32. This bulletin contains a suggested arrangement for the telegraphic notification of accidents to the Safety Division of the Interstate Commerce Commission and the Bureau of Locomotive Boiler Inspection, together with a cipher code adapted for this purpose.

There has been an extremely heavy demand for this bulletin, which was issued with the consent or approval of the heads of both of the departments named above.

Presentation of the railways' case before the Interstate Commerce Commission in the private car investigation, was concluded in June, 1914. The total expense of the proceedings was $6,129.01, which was paid by your Committee and the specific railways which had authorized their representation were billed for their proportion thereof. Your Committee has been reimbursed for all of this expense except $63.24. The opinion of the Interstate Commerce Commission has not yet been made public.

During 1915, the legislatures of forty-three states will be in session.

After considering the matter with some care, your Committee has decided to maintain the arrangement of keeping itself informed of all bills affecting railway operation introduced and passed in all states, and will arrange to notify its supporters of them. During the past four years, 2,443 bills affecting railway operation were introduced in 112 sessions of the various legislatures, of which 360 became law.

On September 5, 1914, Bulletin No. 64 was issued, giving a classification of bills introduced and laws passed in the legislatures in session during 1914.

Your Committee feels that in the states where state committees have been organized, the work done by such committees has been extremely beneficial to the general movement. Their continuance during the session of the legislatures which meet next year is strongly recommended.

LEGAL.

Important Recent Federal and State Legal Decisions Affecting the Carriers.

THE following analysis of the more important Federal and State Court decisions rendered during October and which relate to the operation, management and regulation of the railroads of the United States, constitutes a continuation of the record began in the July issue of the "Railway World." As is apparent, the necessary reference to Court records and authorities is given in each case. Suggestions regarding these records will be thankfully received as an effort is being made to make them of practical value to the legal departments of the various railways.

Counsel Fees in Foreclosure Suit.—(Federal, New York.) Where the property of a railroad company sold on foreclosure realized a surplus above the mortgage debt, the court properly refused to award counsel for a holder of the bonds which, as trustee, held a subordinate lien thereon and was interested with complainant, a fee out of the fund generally which would require the company to pay it, but left him to his statutory lien on that portion of the fund belonging to his clients.—(Farmers' Loan & Trust Co. v. New York Ry. Co., 215 Fed. 712.)

Congress May Charter Railroad Company.—(Federal, New York.) Under its power to regulate commerce, establish post roads, and provide such facilities as it may deem proper, and as military exigencies, when they arise, may require for the transportation of troops and munitions of war, Congress has power to charter a corporation to build and operate a railroad whereon interstate commerce may be conducted, and the mail, troops, and munitions of war may be transported, and for this purpose it is proper that such corporations be authorized to conduct the general business of a common carrier for its own purposes, in addition to serving the government.

Congress having incorporated an interstate railroad company to engage as a common carrier in interstate commerce, and also to serve the government by the transportation of mails, troops and munitions of war, the states through which the railroad was located had no power to announce conditions for the non-compliance with which the corporation would be excluded from doing business in the state, and hence Const. La., as amended (see Act No. 10 of Ex. Sess. 1907), providing that any federal, foreign or non-resident corporation which should institute any suit, or action in, or remove the same to any federal court within the state should be prohibited and denied the right to operate, conduct, or do any business within the state, and that thereafter any contract, agreement, engagement, or undertaking with or by such corporations should be null and void, was invalid as to such railroad company.—(Mercantile Trust Co. v. Texas & P. Ry. Co., 216 Fed. 225.)

Dynamite Must Be Accepted for Transportation.—(Federal, New York.) Dynamite has become a necessity in the industries, and the construction of works of public improvement, and is a legitimate subject of commerce which a common carrier is bound to accept and transport, and, so far as the carrier is concerned, such injury as necessarily results to others from the performance of its duty, without negligence, must be borne by them as an unavoidable incident of the lawful conduct of legitimate business.

A shipment of explosives in interstate or foreign commerce while in course of transportation is subject exclusively to the regulations prescribed by the Interstate Commerce Commission, and state or local laws have no application to it.

A railroad company, which directed a connecting vessel to discharge at one of its piers, where she was destroyed by an explosion of dynamite being unloaded from a car on such pier, held not liable because of its failure to notify the master of the presence of the dynamite, which was a commodity commonly handled at such places and usually with safety, and where also the cars were marked with the regular danger placards.—(Ingred v. Central R. Co., 216 Fed. 72.)

Turntables.— (Federal, Eastern Kentucky.) The turntable doctrine imposes a liability on a property owner for injuries to a child of tender years, resulting from something on his premises that can be operated by such a child and made dangerous by him, and which is attractive to him, where he fails to protect the thing so that such a child cannot be hurt by it.—(Barnhill's Adm'r. v. Mt. Morgan Coal Co., 215 F. 608.)

Question of Safety Must Be Considered by Jury.—(Federal, Western Virginia.) In an action for death of a railroad employe under Federal Employers' Liability Act (35 Stat. 65), by being struck by a train while decedent was working on a bridge evidence held to require submission to the jury of the railroad company's negligence in failing to keep a proper lookout and to warn decedent of the danger.—(Norfolk & W. Ry. Co. v. Holbrook, 215 Fed. 689.)

Need Not Run Trains at Loss.—(Federal, New York.) Where a railroad operated a line between two cities, and sufficient steam trains were run to accommodate the necessities of the people of those cities and an intervening city, and two steam trains a day each way were run which reasonably served the convenience and supplied the reasonable necessities of four small intervening points, the residents of which also had the convenience of a through interurban trolley line, complainant would be considered as having performed its whole duty to the public, and could not be compelled by the public service commission to operate two additional trains over the road each way per day at a net loss of over $3,000 per annum.—(Delaware, L. S. W. R. Co. v. Van Santwood, 216 Fed. 252.)

Recovery for Damages.—(Pennsylvania.) An adjoining land-owner could not recover for damage from smoke, soot, noise, or vibrations resulting from the operation of a railroad, where it was conceded that the engines were equipped with all known appliance to reduce the amount of smoke and soot, and there was no evidence of negligent or unskillful operation.—(Meyers v. Penn. Co., 91 A. 919.)

Conditions May be Imposed on Railway Company.—(Pennsylvania.) Pennsylvania Const. art. 17, sec. 9, providing that no street railway shall be constructed in a municipality without the consent of the local authorities, authorizes a borough to impose conditions on a street railway company as a consideration for the consent given. —(Carlisle v. M. M. S. Ry. Co., 91 A. 959.)

Negligence on Part of Employe.—(Pennsylvania.) Where a railroad yard employe, while on an errand for his foreman and before entering a building, noticed an engine standing on the track, and, though on leaving the building his view of the engine was obscured by an open door, neglected to push the door back to see that the track was clear, and was caught between the side of the building and the engine, he was guilty of contributory negligence barring recovery for his injuries.—(McCabe v. Bessemer Ry. Co., 91 A. 957.)

A Matter of Damages.—(Pennsylvania.) A plaintiff, dissatisfied with the amount of a verdict in his favor could not complain on appeal that the instructions directed the jury that plaintiff could not recover more than the amount of damages claimed in the trial.—(Young v. Penn. R. Co., 91 A. 919.)

Argument of Counsel Cause of Error.—(N. H.) In a damage suit against a railroad company argument of plaintiff's counsel that the verdict was not a very serious matter to the railroad, "taking from them a few coppers, but it means a good deal to" plaintiff, constituted prejudicial error, and entitles the railroad company to a new trial.—(Caverhill v. Boston & M. R. R.)

Actions for Personal Injuries.— (Maine.) Where plaintiff recovered a verdict on testimony that, as a result of his injuries, he was suffering from an incurable disease, was physically wrecked, and was able to do but little, if any, manual labor, newly discovered evidence that soon after the trial he went on a hunting trip, and later engaged in heavy work, and in dancing, being sufficient to render it probable that the verdict would be different on another trial, required the granting of a new trial.—(Southand v. Bangor & A. R. Co., 91 A. 948.)

Injuries to Passenger in Alighting.— (Virginia.) The complaint of a passenger for injuries in alighting, her coach being stopped beyond the station platform, and she being required to alight, where the ground was rough and thirty inches below the lowest step of the coach, no steps or aid by the conductor being furnished, held to state a good cause of action.—(Honaker v. New River H. & W. R. Co., 82 S. E. 727.)

No Authority to Condemn Land.—(Virginia.) Where, in proceedings by a railroad company to condemn land for an extension, the railroad's right to condemn the land was put in issue, and there was no proof that the railroad's directors as a board had ever authorized the extension of the line or had ratified the act of its general manager in attempting to procure land for such extension, the proceeding was unsustainable.—(Honoker v. New River H. W. R. Co., 82 S. E. 727.)

Negligence of Parent.—(New York.) Where a three year old child, who was permitted by his mother to go unattended, except by a four year old companion, and to play in the neighborhood of a railroad crossing at which there had never been a watchman and near which the parents had lived for several years, was struck by a train while crossing the track, the mother's negligence precluded recovery against the railroad company.—(Kieley v. New York Cent. R. Co., 149 N. Y. S. 299.)

Interpretation of Franchise.— (New York.) Where the language of a franchise is ambiguous, it will be construed against the grantee and in favor of the public, but, where free from ambiguity, the court will give force to its provisions, giving the language used its ordinary and accepted meaning.—(Raynor v. N. Y. S. L. I. Traction Co., 149 N. Y. S. 151.)

Railroad Land Subject to Right of Way.—(New York.) A lot condemned by a railroad company for railroad purposes, but not otherwise dedicated to or used by the public, may be subject to a private right of way easement acquired by prescription.—(Hood v. New York Central R. Co., 149 N. Y. S. 262.)

Bridges Property of City.—(New York.) The fact that a railroad company had been obliged to meet the larger portion of the expense of constructing bridges to carry streets over its tracks does not give it title to the bridges, which, being erected in the streets, are the property of the city.

The state may compel a railroad company, at its own expense, to eliminate crossings at grade by a depression of its tracks and the erection of bridges to carry streets over its right of way.

Where relator, under different agreements, constructed 58 bridges, carrying as many streets, in the borough of the Bronx over its right of way and tracks, which bridges were located entirely in the street and used by the railroad company only in some cases to support signal apparatus, such bridges belonged to the city and were not taxable to the railroad company as its property, but not so as to a tunnel constructed by the railroad for its exclusive use under a street.—(People ex rel New York Cent. R. Co. v. Purdy, 149 N. Y. S. 317.)

Backing Cars onto Street Crossing.—(Illinois.) A railroad company was negligent in backing cars onto a street crossing on a foggy night without any light or brakeman on the rear car.—(Coulter v. Illinois Central R. 106 N. E. 258.)

ORGANIZATION NOTES.

November Meeting of Canadian Railway Club.—The Canadian Railway Club which held its November meeting on the 10th of the month, was addressed by Mr. E. B. Tilt, engineer of tests, Canadian Pacific Railway, on: "Characteristics of Materials." Mr. Tilt dealt with his subject under the following heads:

Iron and Steel Products; Lumber; Brasses and Bronzes and other Alloys; Paints and Rubber Products. In discussing the iron and steel products, he dealt largely with their carbon content as being a very important factor in their proper production. He asserted that cast iron is still used for many purposes and that the largest castings are locomotive cylinders and car wheels. Very few driving wheel centers, however, are now made of cast iron and this material should not be used where it will be in tension unless these stresses are very low. Mr. Tilt also pointed out that, in addition to the steels, a number of alloy steels are now employed, the best known of which was vanadium.

Gathering of Traveling Passenger Agents at San Francisco.—The annual convention of the American Association of Traveling Passenger

T.P.A.
PASSENGER STATION
CHICAGO & NORTH WESTERN RAILWAY

SPECIAL TRAIN OF THE AMERICAN ASSOCIATION OF TRAVELING PASSENGER AGENTS AT COUNCIL BLUFFS, IOWA.

Agents was held October 12th and 13th, at San Francisco. The slogan of the convention was California, 1915, and the annual meeting was held in San Francisco in order to intelligently develop plans for a nation-wide campaign to bring the public to the Panama-Pacific International Exposition. The passenger men were entertained by the officials of the Exposition and were afforded an opportunity to inspect and study the grounds and buildings, the latter being for the purpose of bringing from first-hand observation, this important occasion prominently before the people in their respective territories. The members also proceeded on a tour through California visiting the grounds and buildings of the Panama-California Exposition at San Diego, Cal.

The accompanying illustration shows the special train of the passenger men at Council Bluffs, Iowa. Two hundred members and their families were temporarily domiciled in this train which was equipped with every feature of comfort and convenience for the party.

No Postponement of the International Engineering Congress at the Panama-Pacific International Exposition in 1915.—A report having recently been circulated to the effect that the International Engineering Congress was to be abandoned, we desire to state that this is not correct, but that the Congress will be held in San Francisco as scheduled, from September 20th to 25th, 1915.

In view of the conditions now prevailing in Europe, the governing bodies of the five National Societies under whose auspices the Congress is to be held, have recently given careful consideration to the feasibility of holding the Congress and to the probability of its success, with the result that each body has unanimously confirmed its original pledge to support the Congress. The Committee of Management is actively proceeding with arrangements, which are now well advanced, for meetings on the scheduled dates and for the publication of the transactions.

The Committee of Management is in receipt of a sufficient number of communications from various foreign countries throughout the world, including those located within the war zone, to indicate that a large majority of the papers originally requested for presentation at the sessions of the Congress and publication in its transactions will be handed in on time, and that the Congress will be truly international in character.

This great organization is being developed under the direction of the American Society of Civil Engineers; American Institute of Mining Engineers; American Society of Mechanical Engineers; American Institute of Electrical Engineers and the Society of Naval Architects and Marine Engineers. Colonel G. W. Goethals has consented to act as honorary president of the Congress and is expected to preside in person over its general sessions. Honorary vice-presidents include eminent engineers from all sections of the world and papers will be presented before the Congress from the following countries: Argentine Republic, Australia, Belgium, Brazil, Canada, China, Egypt, France, Germany, Great Britain, Holland, Hungary, Italy, India, Japan New Zealand, Russia, South Africa, Spain Sweden, Switzerland, United States.

How little effect the war will have upon the presentation of these papers is indicated by the fact that out of a total of 290 originally contemplated, about 220 are either definitely promised or well assured and of the remainder, are included contributions from nations in the present European war zone and it must be expected that some portion of them will not be secured. It is believed, however, that by substituting for these papers certain others which have been offered, and by taking advantage of other conditions which may yet arise, the general plans for the Congress may be carried with a minimum of change. The general questions to be discussed have been arranged for under the following heads:

The Panama Canal (24 topics); Waterways (6 topics); Irrigation (11 topics); Railways (7 topics); Municipal Engineering (8 topics); Materials of Engineering Construction (20 topics); Mechanical Engineering (28 topics); Electrical Engineering (8 topics); Mining Engineering (10 topics); Metallurgy (10 topics); Naval Architecture and Marine Engineering (19 topics) and miscellaneous.

Fifteenth Annual Meeting of Civic Federation.—The national problems arising out of the war will be considered at the fifteenth annual meeting of the National Civic Federation to be held in New York City on December third, fourth and fifth.

Ralph M. Easley, chairman of the executive council has issued a statement describing the scope of the program. Mr. Easley's statement is, in part, as follows:

The frightful cataclysm in Europe has brought this country face to face with tremendous and perplexing problems—commercial, political and industrial. Some of the commercial questions have for years been mulled over and quarreled over, but they have been treated from selfish commercial or selfish political standpoints. Under the present strain, our people are rising to the occasion and dealing with them in a more intelligent and patriotic spirit.

Besides distinctly commercial matters, there are others whose consideration calls for statesmanship of a high order. They concern not only the banker, the merchant and the manufacturer, but also the farmer, the wage earner, the publicist and the humanitarian.

Behind the cry of "Emergency" looms the larger question: "How far shall we substitute governmental action for private enterprise?" Under the pressure of a sudden rise in the cost of many of the necessaries of life came proposals to have the government take over coal mines, packing-houses and flour mills, to purchase ships for transportation purposes, to establish depots where the city would sell food to the people at cost, and to construct municipal dwellings and enter into a large program of road building and reclamation schemes to furnish employment for the idle. A new stimulus has also been given to those who advocate the idea of the Federal Government taking over the railroad, telegraph and telephone systems, and municipalities taking over gas, electric light and street railways. Already government war risk marine insurance is an accomplished fact. Proposals for guaranteeing the price of silver, cotton, wheat, tobacco and even canned salmon and naval supplies appeared suddenly in Congress. Naturally enough, the apple growers' association also began agitating for the government to take care of the apple crop—all "on account of the war." Many advocates of these measures were thinking only of the present crisis, but others seized this opportunity to promote their special philosophy which calls for the government's taking over and doing about everything that is done to-day by private capital. Conceding that there may be emergencies which private enterprise cannot meet and which call for action by the government, the question is: "Where should the line be drawn?" This will be one of the principal subjects to be discussed at the forthcoming annual meeting of the Federation.

The Workmens' Compensation Department will report provisions requisite to adequate workmens' compensation laws, taking into consideration the best features of the statutes now existing in twenty-four States. Its work in the interest of uniformity of State legislation is of great moment now, as forty-one legislatures hold sessions this winter. There will also be brought to the attention of the Federation the necessity for establishing a central bureau for the tabulation of statistics upon amounts paid to injured workmen, cost of insurance to employes and types of accidents most prevalent.

Unemployment during the coming winter may develop into a serious problem. Whatever our governmental policy on that question may eventually be, voluntary effort will count most at this time. While many thrown out of work in the first weeks of the war are again at work and, as order comes out of the chaos into which many industries were so suddenly plunged, much of the trouble is disappearing, it is important to know the extent of unemployment due to the war. On this point, the Federation has sent an inquiry to manufacturers, bankers, trade journals and commercial, charity and labor organizations. It is expected that the replies will be of service to those who are making every effort to reduce unemployment and its resulting distress to a minimum. In this connection, it must not be forgotten that those forces of destruction which have already given us a taste of their revolutionary methods will seek this opportunity to preach their doctrines of class hatred in furthering their propaganda for the overthrow of present social institutions.

In connection with this phase of the question, a special committee will report its conclusions as to the limitations of the free speech and right of assembly clause of the Federal and State constitutions.

A SURVEY OF SOCIAL AND INDUSTRIAL PROGRESS

A report of progress will be made by the Industrial Economics Department of the Federation upon the social and industrial survey which it has been conducting during the past year. The object of the survey is to summarize the changes in our national life and to gather together the essential material from which to judge where there has been an advance in well-being, where there has been a loss, and how far in the aggregate gains and losses balance or outweigh each other.

Meeting of Chicago Northwestern's Safety Congress.—The third annual safety congress of the Chicago Northwestern Railway was held at the La Salle Hotel, Chicago, October 14th, under the auspices of the National Council for Industrial Safety. One delegate from each division, terminal, shop and local safety committee, attended as a guest of the company.

As evidenced by the following resolution of thanks voted unanimously by the delegates to President Gardner and Vice-President Aishton, the men gained much knowledge and information by their attendance at the Congress.

We, the undersigned delegates selected by the various Safety First Committees of the Chicago and North Western Railway to attend the Third Annual Safety Congress held in Chicago on October 14th and 15th, 1914, during which time we have been the guests of the Company, and

Whereas, We have obtained much valuable knowledge and information which will be of

Safety First Men of the Chicago and North Western Railway, Who were Guests of the Company at the Third Annual Safety Congress Held in Chicago on October 14-15.

great help to us in further promoting the Safety First work on the North Western Railway,

Resolved, That we desire to express to President Gardner and Vice-President Aishton our thanks and appreciation of the kindness and consideration shown us in arranging for our attendance and entertainment at said Congress.

Fall Meeting of American Railway Association.—The fall session of the American Railway Association, was held in Chicago on November 18th. Reports were presented by the following committees: The Executive Committee; the Committee on Transportation; the Committee on Maintenance; the Joint Committee on Automatic Train Stops; the Committee on Relations Between Railroads; the Committee on the Safe Transportation of Explosives and Other Dangerous Articles; the Committee on Electrical Working, and the Committee on Nominations.

Fall Meeting of Railway Development Association.—The fall meeting of the Railway Development Association was held in Chicago on November 10th-11th. In opening the meetings an address of welcome was extended by Mayor Carter Harrison of Chicago, which was responded to by F L. LaBaum, of the Norfolk and Western Railway, who is president of the Association. "Personal Work with Farmers," was discussed by N. V. Richards, of the Southern Railway and H. M. Rainer of the Santa Fe System, while "Diversified Farming and its Relation to the Cotton Grower," was dealt with by J. C. Clair, of the Illinois Central and J. F. Jackson of the Central Railway of Georgia. H. B. Fullerton, of the Long Island Railroad, delivered an illustrated address on: "Plans for Increasing the Tonnage of Agriculture for Railroad Transportation." Other subjects presented and discussed were as follows:

"The Relation of Railway Terminals to Industrial Development," by Frank A. Spink, of the Chicago Belt Line and "The Advertising and Exploiting of Industrial Advantageous," by R. W. Cooke, of the Pennsylvania Lines West.

In addition to the above, President LaBaum told of the efforts of the railroads to get city people to engage in farming, L. J. Bricker, of the Northern Pacific, discussed "Desirable Immigration," D. G. Mellor, of the Wells Fargo Express Company and William Gourlay, of the American Express Company, explained how the efficient marketing of farm products could be stimulated and increased and Mrs. Edith Fullerton, vice-president of the Women's Horticultural and Agricultural Association, read a paper on "Country Farm Development," illustrated by lantern slides.

The annual dinner of the Association took place on the evening of November 11th, and addresses were delivered by W. L. Park, vice-president of the Illinois Central Railroad, Samuel O. Dunn, editor of the "Railway Age Gazette" and George A. Blair, assistant freight traffic manager of the Chicago, Milwaukee and St. Paul.

A feature of the meeting was an exhibition of the work of the agricultural, immigration and industrial departments of the railways showing the work on the demonstration farms as well as other features of railroad development activity.

TRAFFIC.

Traffic Through the Panama Canal.—The Panama Canal has now been opened to shipping for a period somewhat over two months and while the European war has undoubtedly greatly retarded the normal movement through this waterway, the record is of interest to all those engaged in commercial pursuits. During the period from

August 15th to October 15th, commercial vessels employing the Canal have carried through it 583,949 tons of cargo. The traffic has followed fairly well defined trade routes, and the course of the great majority of vessels may be roughly classed in four great groups.

The heaviest traffic has been between the Atlantic and Pacific coasts of the United States. Manufactured goods of great variety and general merchandise are carried from the Atlantic seaboard, principally from New York, and secondarily from Boston, Philadelphia and New Orleans, to the principal California and Puget Sound ports; also, to Honolulu. On the eastbound voyage, these vessels carry chiefly canned fruits, vegetables, and salmon, lumber, grain, sugar, pineapples and wine. This trade is restricted to vessels of American registry, and nearly all the American vessels which have used the Canal have been engaged in it. During the period of Canal operation, 24 vessels have passed through eastbound on this route with 151,290 tons, and 25 westbound with 135,214 tons. These passages, 49 in all, have constituted approximately 44 per cent of all the 113 passages through the Canal. The total cargo carried on this route, 286,504 tons, has been almost exactly 50 per cent of all cargo.

A route between the eastern coast of the United States and the west coast of South America has been second in cargo through the Canal. Northbound vessels carry principally nitrates from the fields of Chile, with secondary cargo of raw material products of the western countries of South America, and southbound vessels carry manufactured goods from the United States and Europe. The northbound traffic, passing 13 vessels with 93,139 tons, through the Canal during the two month period, has considerably exceeded the southbound consisting of three vessels with 18,800 tons, and one in ballast, though the latter seems to be getting under way.

There has been a marked, though probably seasonal, traffic from the Pacific ports of the United States and southwest Canada to Europe with grain. Ten vessels, each heavily laden, have gone through eastbound, with 71,560 tons, and eight vessels, all of foreign registry, have gone from the Atlantic to the Pacific in ballast, to return on this route with grain. In addition, one vessel, which went through the Canal with 6,000 tons of manufactured goods, from Antwerp to Tacoma, is to return with grain.

The fourth great route has been from the Atlantic seaboard of the United States to China and Japan, with refined petroleum in bulk and in cases, and other petroleum products. Four vessels have gone through in this trade from the Gulf of Mexico, with 24,931 tons, and four from Philadelphia and New York, with 26,570 tons, an aggregate of 51,501 tons. No vessels have gone in the other direction on this route.

Next to the four principal routes just described, the most notable development has been the coal traffic from the middle Atlantic seaboard of the United States to the Pacific Coast of North and South America. Five vessels, four from Norfolk, with 22,535 tons, and one from Baltimore, with 6,000 tons, have carried coal to the upper Pacific, and one vessel from Baltimore has carried 6,010 tons to Valparaiso. The total coal carried has been 34,545 tons. None of the vessels has returned through the Canal to this time, but it is understood they will load with Pacific coast products for the eastern United States and for Europe.

The development of a line from Liverpool around South America, with vessels sailing both ways, via the Canal, has been arrested by the European war. The only vessel to have used the Canal in this route was the steamship Potosi, which passed through the Canal on September 25th, on its way south, along the west coast of South America. It was held in the bay at Balboa, awaiting orders, but sailed on October 14th.

The steamship Desabla, which passed through the Canal on October 12th, in ballast, was on its way from Rio de Janeiro to San Pedro for a cargo of fuel oil.

The military service of the United States has used the Canal for the passage of one army transport and one navy collier, both from Pacific to Atlantic.

Road Inspection by Passenger Traffic Official.—To see itself as others see it is a plan adopted by the Baltimore and Ohio Railroad in sending an assistant general passenger agent on a 5,000 mile tour of its tracks on an inspector's gasoline tri-cycle to collect first-hand information concerning the degree to which the service meets the requirements of communities, as well as to ascertain the attitude of public opinion and exchange views with patrons, agents of the railroad and others interested in a high standard of transportation facilities.

The trip has been begun by Wm. E. Lowes, assistant general passenger agent at Baltimore, who will be engaged on the work for several months as weather conditions permit and who will compile a report for the information and records of the general officers. Accompanied by a photographer and a supervisor of tracks, Mr. Lowes has covered a portion of the main line and branches of the eastern divisions on his scouting expeditions.

Garbed for roughing it, with baggage forwarded ahead and carrying only such necessary articles as a dispatcher's schedule of trains to be met and passed and a notepad, camera and box lunch, the main line of the Shenandoah Valley from Harper's Ferry to Lexington and the line along the south branch of the Potomac River from Green Spring to Petersburg, W. Va., have been traveled over. Also the territory in eastern Ohio from Zanesville to Marietta has been visited, and in these sections a number of exquisite photographs of historical interest and scenic beauty was made and will be used for advertising purposes.

It is impossible to set a time when the tour of observation and education will be completed and a report submitted to the Baltimore and Ohio officials, as progress on the work will be governed by local conditions in the communities visited. Up to this time it has been possible to travel from fifty to sixty miles a day, stopping to talk over business conditions with agents at small stations, as well as to farmers in the fields and workmen in industries along the route. The gasoline tri-cycle used by the officials is operated through communication with the train dispatcher and train crews are advised to be on the lookout for it in order to minimize the danger of accident.

When visiting a small agency, Mr. Lowes discusses the service with the agent, examines the station and offers and receives suggestions as to the needs of patrons. From farmers he obtains information concerning the fertility of soil and its adaptability to particular phases of farming, learns the yield per acre in the community and the amount of fertilizer, farming machinery and articles shipped in; and in turn such information as the most available market paying top prices for farm products is imparted. If further assistance be desired by the farmers, the matter is taken up with agricultural department of the railroad. The capacity of industries, number of persons employed, markets for the output and source of raw materials is ascertained from those in charge, and a desire for further information is communicated to the industrial department. In this way the railroad is adopting an effective way of placing the co-operation of its various departments concerned with the development of business at the service of those desiring such assistance.

Solving the Traffic Problems of the Panama-Pacific International Exposition.—The exposition is provided not only with its own standard gauge railway leading into all the main exhibit palaces, but it has its own freight and passenger ferry slips. The efficiency of its traffic system was early demonstrated in the transportation of all the building materials that have gone into the construction of the exposition; this included, among other items, some eighty million board feet of lumber and forty thousand tons of plaster for the main exhibit section alone.

The capacity of the exposition railway system will admit of the receiving and unloading of fifty carloads of exhibits a day during the busiest season. It is possible to dispose of one car float an hour, or between four thousand and five thousand cars per month.

It is estimated that between seventy and eighty thousand tons of exhibits will be transported to the exposition and the first exhibits reached San Francisco as early as last May. More than eleven hundred tons of exhibits were received from Japan alone in October.

By arrangement with the railroad companies all exhibits are carried at half rates; that is, the full rate is charged from the shipping point to the exposition, but the return carriage is free. To accommodate the exposition freight and passenger traffic many of the railroads have made extensions and enlargements along their routes, improvements which are justified by the estimated expenditure of $5,000,000 in freight for exhibits and $125,000,000 for passenger fares during 1915.

Wheat Exports for Three Months' Period.—Large exports of domestic wheat in the three months which ended with September, 1914, brought the total for that period up to the highest point ever reached in the corresponding months of any year in the history of our export trade. The total exports of wheat, including flour in terms of wheat, in the first quarter of the current fiscal year aggregated 89¼ million bushels, as against 59 million in the corresponding period of last year and 83 million in the July-September quarter of the fiscal year, 1902, when exports of domestic wheat rose to their previous highest level. In the fiscal year 1902, the total was 234,772,515 bushels. Figures published in the "Monthly Summary of Foreign Commerce" by the Bureau of Foreign and Domestic Commerce of the Department of Commerce show that the exports of wheat in the quarter which ended with September last, exceeded those of the complete fiscal years 1910, 1911 and 1912.

Most of this greatly increased exportation of domestic wheat was distributed to European countries, September alone showing consignments of wheat, exclusive of flour, in the following amounts: To France, 7,572,000 bushels; the United Kingdom, 6,640,000; the Netherlands, 2,201,000; and other Europe, 5,390,000. Over 2,560,000 bushels were exported last month to Canada, while a very unusual transaction was the shipment of 580,000 bushels of wheat from Port Arthur, Texas, to Brazil. The notable feature

COMMUTERS RAILWAY, PANAMA-PACIFIC INTERNATIONAL EXPOSITION GROUNDS, FROM THE OAKLAND SIDE OF SAN FRANCISCO BAY.

in the outward movement of flour was the marked gain in shipments to Brazil and other countries of South America. Exports thereto in September were nearly double those of a year ago, while the aggregate to foreign countries as a whole showed practically no change.

In addition to largely increased exports, the outbound movement of other grains and grain products as well as of meats and other articles of food, showed a heavy increase during September as compared with similar movements for the corresponding month in 1913. Exports of fresh beef for example, during the month, amounted to more than 7,000,000 pounds or eleven times the total for September, 1913. More than 6,000,000 pounds of this amount went direct to France. In addition, practically 3,000,000 pounds of canned beef were exported, being eight times as much as in the same month of last year, and far above the average level for the past decade.

EQUIPMENT.

New Inter-Locking Plant for Southern Railway.—Southern Railway has begun the installation of a modern inter-locking plant at Helena, Ga., where the tracks of its Atlanta Division, over which its fast through trains between Florida and the West move, cross the tracks of the Seaboard Air Line. This improvement will remove the possibilities of a collision at this crossing and will also facilitate train operations through Helena.

At the intersection of the two lines a tower is being built from which the signals and switches will be operated. Derails will be installed on all the tracks, and the plant will also include distant signals operated by power from the interlocking plant and annunciators which will automatically inform the tower operators of the approach of trains.

New Steel Postal Cars for the Rio Grande.—Ten new all-stel combination mail and baggage cars have just been purchased by the Denver & Rio Grande Railroad and are now in service on that road in through runs between Denver, Salt Lake City and Ogden. The cars are of the latest type in every particular and are built in strict accordance with specifications recently adopted as standard for mail cars by the Federal Government, being 70 feet long inside, 30 feet of which is taken up as mail room and 40 feet for baggage. The interior fittings are of steel design with the most modern appliances for heating, lighting and ventilation and are equipped with all-steel trucks, steel wheels and high speed brakes.

Installation of Automatic Electric Block Signal System on Southern Railway.—The Southern Railway has completed the installation of an automatic electric block signal system on the double track line between Knoxville and Morrisville, a distance of 42 miles, thus providing the most modern protection for one of the most important lines on the Southern Railway System, over which are handled the through trains between Memphis and New York, between New Orleans, Birmingham, Chattanooga and New York, and a large part of the travel to Asheville and other Carolina resorts.

Signals have been erected at intervals of about two miles. A train immediately in advance of a signal or in the first block will cause it to indicate DANGER or STOP and at night show a red light. A train in the second block ahead will be indicated by the signal standing in the CAUTION position and showing a green light at night. If the track is clear of all trains for at least a distance of four miles or two blocks the signal will indicate CLEAR with a white light at night.

In addition to indicating the presence of a train in either the first or second blocks, the signal will also stand in the danger position if there should be an open switch, a broken rail, bridge out, or any other obstruction which would endanger the safety of trains, thus providing a very large measure of safety by giving the engineer advance information of conditions ahead.

CONSTRUCTION.

Northern Pacific Completes Through Line to Eureka.—On October 23rd, President W. S. Palmer, of the Northwestern Pacific, which line is owned jointly by the Southern Pacific and Atchison, Topeka and Santa Fe, swung the silver hammer on the gold spike that completed the Northwestern Pacific's through line from San Francisco to Eureka, Cal. The occasion was one of great rejoicing, for, previous to Friday, Eureka held the distinction of being the largest city in the United States not enjoying railroad connection with the outside world.

The spike-driving ceremony took place at Cain Rock Bridge. It was attended by Mayor Clark of Eureka, Mayor Rolph of San Francisco, executive officials of the Southern Pacific and Santa Fe, and representatives of practically all the important cities and towns of California.

The work of connecting up the southern and northern portions of the system has been under way for seven years, involving an expenditure of $12,000,000, and representing one of the most formidable feats of railroad construction ever undertaken in the United States. The length of new construction is 105 miles, of which there are 59 miles of curved track and 46 miles of straight. The Northern Pacific has a total mileage of 550. It has 28 tunnels, in the lining of which there are 12,000,000 feet of lumber. The maximum grade, eastbound, is three-tenths of one per cent; westbound, seven-tenths of one per cent.

The total amount of bridge steel between Willits and Shively is 10,286,312 pounds, distributed among 23 bridges. The longest bridge, the Cain Rock crossing of Eel River, is 1115 feet in length; the shortest bridge, across Woodman Creek, is 50 feet in length. The aggregate steel bridge length is 7001 feet.

FOREIGN RAILWAYS.

Government Ownership in Russia Unsatisfactory.—Had Russia's government railways been operated as economically in 1910 as were her private lines the saving in operating expenses would have exceeded $37,000,000. Such a discrepancy in comparative efficiency of state and private railway operation in Russia is brought out in the annual report for 1910.

Private companies in European and Asiatic

Russia operate 13,256 miles of railway against 28,366 miles operated by the state. In 1910 these companies paid out $59 to operate, for every $100 received in gross revenues. Against this showing the state railways spent $70. Moreover, whereas in 10 years since 1901 the private companies effected a reduction in operating expenses from $68 for every $100 revenue to $59, a saving of over 13.2 per cent, the state railways in the same time contracted their expenses only 1.4 per cent, from $71 to $70. With over $342,000,000 in gross business the government railways would have saved exactly $37,644,903 had they equalled the private companies' performance.

Overstaffing of the government railways is largely responsible for this unfavorable showing. Whereas the private companies handle a relatively larger traffic, $12,989 per mile against $12,426 on the government roads, they accomplished the work with only 169 employes for every 10 miles against 203 for every 10 miles on the state railways. Even more striking than this discrepancy is the gap between Russia's most efficient roads and railways of the United States, which in 1910 operated with only 70 employes for every 10 miles of line.

During the entire year 1910 Russia, with an area almost three times that of the United States, added only 40 miles to operated railway mileage, leaving her with 41,622 miles of railway, or only one-half mile per 100 square miles of territory, against over 8 miles in the United States. This left the United States sixteen times as well provided with railways as Russia in relation to territory. Since 1910, however, Russia has awakened to the need of railways and a large mileage is now under construction.

Despite their inferiority in every detail of equipment this Russian system cost in 1910, almost $22,000 per mile more than our own. Capital per mile stood at $84,299, against which the railways of the United States, often accused of over-capitalization, had produced the most efficient transportation system in the world at a cost of less than $63,000 per mile.

Comparison of rates charged in the two countries likewise demonstrates the efficiency of the United States railway system, for with higher cost of materials, wages four times those paid to Russian railway employes, and with the value of the cent correspondingly higher in Russia than in this country, United States railways received only 0.75 cents per ton mile against 0.94 cents received by Russian carriers. Average receipts per passenger mile were only one-third ours, but 91.5 per cent of the travel was third and fourth class against one-half of one per cent first class. One day's wage, 70.5 cents, will buy 103 miles of this third and fourth class travel in Russia against 124 miles of first class travel for a day's wage in the United States.

Railway Construction in Canada.—What the railroads of Canada are accomplishing in the way of construction during this year of abnormal conditions is revealed in a series of official communication secured by your correspondent from the Canadian Pacific, Grand Trunk and Canadian Northern Railway companies.

As regards the Canadian Pacific Railway, the programme of construction for 1914 was restricted almost entirely to the laying of steel on grading which had already been completed. The only major operation was the driving of the tunnel at Glacier in the Selkirks. The work in this tunnel is continuing as usual, the position early in September being that the pioneer heading at the east end was driven in over 4,000 feet and at the west end over 1,000 feet. The main heading was advanced over 1,500 feet at the east end and about one-third of that at the west end.

Construction on the Vancouver Hotel continues uninterrupted. A large amount of steel has been laid but the work for the year is practically complete. Trains have been for some time in operation on the new double track between McLean and Indian Head.

The Kootenay Bay extension of the Esquimault and Nanaimo Railway was opened for traffic in August and no halt has been called on the construction of the Kootenay Central in the Upper Columbia Valley.

What is being done in the west is indicated more fully in an interview with Mr. F. W. Peters, general superintendent of the Western Division of the C. P. R. "As far as I know," said he, "there will be no interruption in construction work. That at the Vancouver terminals is virtually finished as well as the double tracking between Vancouver and Revelstoke. About 3,500 ment are engaged on the Kettle Valley Line and a good force is working on the five-mile tunnel through the Selkirks, near Glacier. We expect to have the Kettle Valley line connected with Vancouver next year. This will be beneficial, of course, to the southern sections of the province. It will provide a new and important outlet for the fruits and other agricultural products and will open up promising mining areas which have been undeveloped thus far owing to inadequate transportation facilities.

"Our grounds for high expectations are solid. They are based upon the immense natural wealth of this country, coupled with steadily improving means of developing this wealth and transporting it to the big markets. The embarrassments of the present cannot last long. For instance, it has been found necessary, because of conditions growing out of the war, to cancel the through freight rate from transatlantic ports to Western Canada. But I do not believe this situation is more than temporary. With the passing of the possible menace to shipping on the Atlantic, the conditions in my judgment will lead to new records of commerce between Canada and the British Isles. Our shipping on the Pacific has fallen off because the government has taken the "Empress of Russia," the "Empress of Asia" and the "Empress of Japan" for purposes of war, but with Japan aiding in the protection of British commerce in the Pacific, we hope and expect that it will not be long before these vessels will not be needed and can be returned to the activities of peaceful trade."

The official statement of work on the Grand Trunk Pacific reads as follows: "We are still ballasting west of Prince George over about 125 miles with a final lift and it is expected that this work will be completed about the 15th of November. Half ballasting has been completed over this part of the line and the work will not be discontinued until the same is completed. The bridge work is about completed on the Prince Rupert end. The only construction work yet to be completed and now under contract, is the erection of the divisional point facilities at Endako, Smithers and Pacific. With the completion of this work the Main Line will be in perfect operating condition from Fort William to the Pacific."

As for the Canadian Northern, there are now only 195 miles in the whole Main Line which are yet untracked. Nearly all of this is graded. The gap in British Columbia trackage amounts to about 163 miles and about 32 miles between Sudbury and Montreal. The Sudbury-Port Arthur section, running about the head of Lake Superior is now ready for operation, while the section from Toronto to Quebec has been in operation for many months. Every effort of the company, which has a working force of nearly eight thousand men, is being directed at completing the Main Line, and the Sir William Mackenzie estimates that the last rail will be laid some time in December or January at a point in British Columbia. By June, of 1915, passenger and freight trains will be run from tidewater to tidewater.

RESIGNATIONS.

Executive.

W. A. Bissell, president, San Francisco-Oakland Terminal Railways.

E. N. Brown, president and director, National Railways of Mexico.

W. E. Minega, president and general manager, Virginia,Carolina Railway and the New River, Holston & Western Railway.

J. E. Votaw, vice-president and general manager, Marshall and East Texas Railway.

Financial.

James Moore, paymaster, Atchison, Topeka & Santa Fe Railway.

E. W. Potts, treasurer, Virginia-Carolina Railway and the New River, Holston and Western Railroad.

Accounting.

T. V. Coleman, auditor, Red River and Gulf Railroad.

D. B. Keiser, car accountant, Galveston, Harrisburg & San Antonio, the Texas and New Orleans, the Houston & Texas Central, the Houston East and West Texas and the Houston & Shreveport railroads.

E. B. Pierce, auditor, Missouri, Kansas and Texas Railway.

Engineering and Mechanical.

K. W. Collister, supervisor, Fourth Division, Erie Railroad.

A. G. Kantman, superintendent of machinery, Nashville, Chattanooga and St. Louis Railway.

Operation.

R. B. Ayres, superintendent, Transcontinental Division, Texas and Pacific Railroad.

T. E. Coyle, superintendent, Northern Pacific Railway.

Traffic.

A. E. Billings, division freight agent, Lake Shore and Michigan Southern Railway.

W. F. Bosald, agent, Lehigh Valley Railroad.

E. J. Cabaret, traveling freight agent, Atlanta, Birmingham and Atlantic Railroad.

M. H. Dorsett, traveling freight agent, Nashville, Chattanooga and St. Louis Railway.

H. G. Elliott, general passenger agent, Grand Trunk Railway.

T. F. Frome, agent, Lehigh Valley Railroad.

F. D. Lamkin, agent, Lehigh Valley Railroad.

C. W. Nash, freight claim agent, Delaware & Hudson Railroad.

H. Osborn, commercial agent, Cincinnati, New Orleans and Texas Pacific and Alabama Great Southern Railroads.

P. F. Spaker, agent, Lehigh Valley Railroad.

R. A. Taylor, freight claim agent, Galveston, Harrisburg & San Antonio, the Texas & New Orleans, the Houston & Texas Central, the Houston East & West Texas, and the Houston & Shreveport railroads.

C. S. Wilkins, superintendent of transportation, Coal & Coke Railway.

S. A. Williams, commercial agent, Cincinnati, New Orleans and Texas Pacific and the Alabama Great Southern Railroads.

Purchasing.

H. C. Hequembourg, general purchasing agent, American Locomotive Company.

ELECTIONS AND APPOINTMENTS.

Executive.

W. H. Biggar, vice-president and general counsel, Grand Trunk Pacific. Headquarters, Montreal, Que.

P. E. Clark, president, Tennessee, Kentucky and Northern Railroad. Headquarters, Nashville, Tenn.

J. W. Evermann, first vice-president, St. Louis Southwestern Railway. Headquarters, Tyler, Texas.

E. W. Grice, assistant to president, Chesapeake and Ohio Railroad. Headquarters, Richmond, Va.

George P. Johnson, president, Virginia-Carolina and the New River, Holston & Western railroads.

A. W. Lefeber, vice-president and general manager, Midland Valley Railroad. Headquarters, Muskogee, Okla.

T. C. McCampbell, vice-president, Tennessee, Kentucky and Northern Railroad. Headquarters, Nashville, Tenn.

Edward Raymond, assistant to vice-president, Atchison, Topeka and Santa Fe Railway. Headquarters, Chicago, Ill.

Walter L. Ross, receiver, Toledo, St. Louis and Western Railroad. Headquarters, Toledo, Ohio.

Samuel C. Scotten, director, the Burlington Route.

Bryan Snyder, vice-president and general manager, Marshall and East Texas Railroad. Headquarters, Marshall, Texas.

G. K. Weeks, president, San Francisco-Oakland Terminal Railways. Headquarters, Oakland, Cal.

Fred Zimmerman, vice-president, Chicago, Indianapolis and Louisville Railroad. Headquarters, Chicago, Ill.

Legal.

C. G. Austin, general solicitor, Chicago & Western Indiana Railroad and the Belt Railway of Chicago. Headquarters, Chicago, Ill.

Financial.

J. H. Ambrose, treasurer, Nashville, Chattanooga and St. Louis Railway. Headquarters, Nashville, Tenn.

T. W. Arundel, assistant treasurer and secretary, Chicago and North Western Railway. Headquarters, New York.

Thomas A. Clarkson, secretary, Nashville, Chattanooga & St. Louis Railway. Headquarters, Nashville, Tenn.

J. S. Crowell, secretary and general superintendent, Red River and Gulf Railroad. Headquarters, Long Leaf, La.

Arthur S. Pierce, treasurer and assistant secretary, Chicago and North Western. Headquarters, New York.

W. C. Reichenbach, paymaster, Atchison, Topeka and Santa Fe Railway. Headquarters, Topeka, Kansas.

H. W. Rush, assistant treasurer and assistant secretary, Chicago and North Western Railway. Headquarters, New York.

Accounting.

G. F. Buskie, auditor, Missouri, Kansas and Texas Railroad. Headquarters, St. Louis, Mo.

J. W. Comiskey, car accountant, Galveston, Harrisburg & San Antonio, the Texas & New Orleans, the Houston & Texas Central, the Houston East and West Texas and the Houston & Shreveport. Headquarters, Houston, Texas.

Earl B. Leach, auditor, Texas City Terminal Company. Headquarters, Texas City, Texas.

H. A. White, auditor and general manager, Red River and Gulf Railroad. Headquarters, Long Leaf, La.

A. R. Wood, assistant auditor, San Antonio & Aransas Pass Railway. Headquarters, San Antonio, Texas.

Engineering and Mechanical.

R. B. Ball, engineer, Grand Division, Atchison, Topeka and Santa Fe Railway. Headquarters, Los Angeles, Cal.

Joseph Billingham, superintendent of motive power, Grand Trunk Pacific. Headquarters, Transcona, Man.

R. H. Boykin, division engineer, The Erie Railroad. Headquarters, Marion, Ohio.

A. C. Bradley, division engineer, Oklahoma Division, Chicago, Rock Island and Pacific. Headquarters, El Reno, Okla.

J. L. Cantwell, general foreman, Southern Railway. Headquarters, Asheville, N. C.

J. A. Cassady, master mechanic, Cincinnati, New Orleans and Texas Pacific. Headquarters, Somerset, Ky.

W. D. Cloud, assistant signal supervisor, Coast Lines, Atchison, Topeka and Santa Fe Railway. Headquarters, Los Angeles, Cal.

J. S. Considine, supervisor, Pennsylvania Railroad. Headquarters, Buffalo, New York.

A. J. Cunningham, inspector of motive power, Pacific District, Atchison, Topeka and Santa Fe Railway. Headquarters, Barstow, Cal.

J. R. Donnelley, assistant master mechanic, Ontario lines, Grand Trunk Railway System. Headquarters, Allandale, Ont.

C. Dougherty, roadmaster, Atchison, Topeka and Santa Fe Railway. Headquarters, Plainview, Texas.

H. B. Hayes, master mechanic, Alabama Great Southern Railroad. Headquarters, Birmingham, Ala.

FOREIGN RAILWAYS.

First Alaskan Railway.—Up to 1898, men who wished to get to the gold diggings along the Yukon River by way of the White Pass had two choices: to pack their own supplies in from Skagway to Lake Bennett, or to pay freighters' rates that often climbed to $1 a pound, writes Aubrey Fullerton in the Bellman. On this same route, Alaskan railroading began in the spring of 1898, and in seven weeks from the turning of the first sod a train was run for four miles out of Skagway. That was the first of many achievements in northern roadmaking, wherein time records were broken and things done that seemed impossible. The road was finished to White Horse in the summer of 1900.

It was not only that this pioneer railroad ran through a mountain country that made its construction so difficult, but that it also was so far north. This meant that it was a thousand miles from the base of supplies ,and every piece of equipment and every tool had to be taken up the coast from Seattle and Vancouver and freighted into the hills. Moreover, this was before the days of northern telegraphs, and the isolation of the road builders was complete. The project was declared by some to be a piece of folly. But they didn't know the man in charge of it, one Hawkins.

On the way to the summit at White Pass the grade, which averages 2.66 per cent, was cut through solid rock. At one point a cliff 200 feet from top to bottom blocked the way, and the whole mass of it was cleared out with powder. Often the grade went up mountain sides so steep that Hawkin's men were suspended by ropes while they drilled the holes for blasting, the like of which had never before been seen in the Alaskan hills.

When it came to boring a tunnel the difficulties were multiplied almost impossibly. The machinery and supplies were packed up a steep, high grade that only mountain climbers could make. But the hole was made, 250 feet long, and the road went through. A steel cantilever bridge, costing $100,000, was thrown over a V-shaped canon a short distance from the summit, 215 feet above the creek bed.

Notwithstanding numerous physical obstacles and such difficulties as the lure of gold "finds," which in one case called away 1500 men in a few days, the road was built to the summit of White Pass, 3000 feet above the sea level. While the gold rush was on, the traffic was heavy, then the road began to attract the sightseers and now it is a tourist road, as well as a freight line to the gold fields.

DIVIDEND NOTICE.

Philadelphia Electric Company, 419 Market Street,

Camden, N. J., Nov. 12, 1914. The Board of Directors have this day declared a quarterly dividend of one and three-quarters (1¾) per cent. (being 39.375 cents a share) upon the paid in capital of the Company, payable Dec. 15, 1914, to stockholders of record Nov. 20, 1914.

H. C. LUCAS, Treasurer.

PATENTS

WILLIAM N. MOORE

WASHINGTON, D. C.

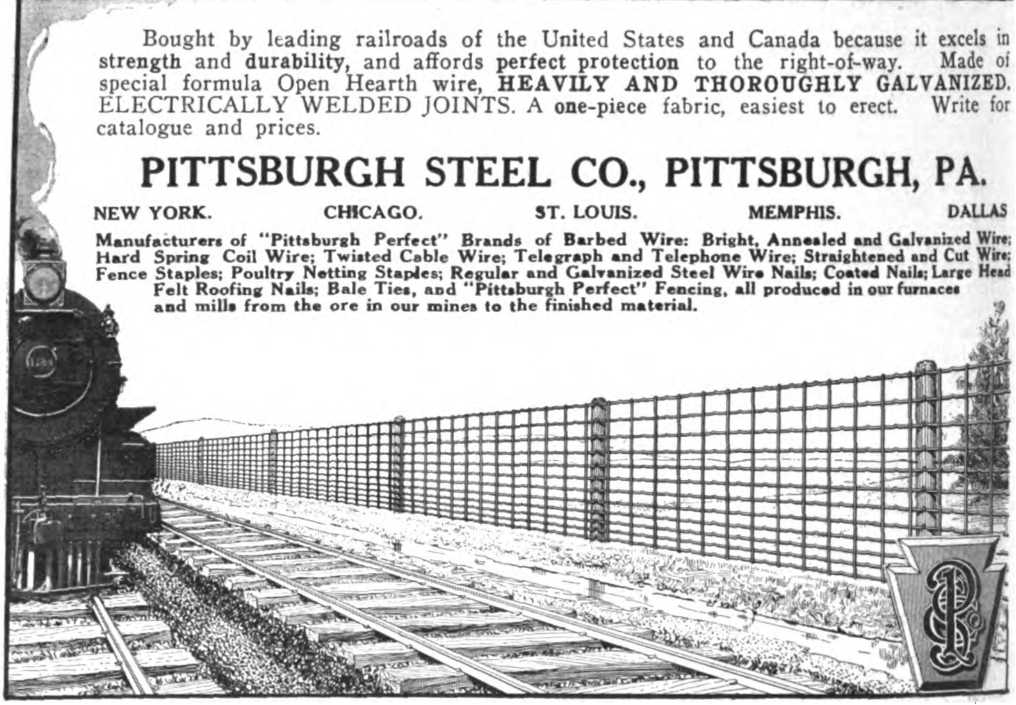
PATENT ATTORNEY

THE first important step is to learn whether you can obtain a patent. Please send sketch of your invention with $5, and I will examine the patent records and inform you whether you are entitled to a patent, the cost and manner of procedure.

PERSONAL ATTENTION

ESTABLISHED 25 YEARS

"Pittsburgh Perfect" Railroad Fencing



Bought by leading railroads of the United States and Canada because it excels in strength and durability, and affords perfect protection to the right-of-way. Made of special formula Open Hearth wire, HEAVILY AND THOROUGHLY GALVANIZED. ELECTRICALLY WELDED JOINTS. A one-piece fabric, easiest to erect. Write for catalogue and prices.

PITTSBURGH STEEL CO., PITTSBURGH, PA.

NEW YORK. CHICAGO. ST. LOUIS. MEMPHIS. DALLAS

Manufacturers of "Pittsburgh Perfect" Brands of Barbed Wire: Bright, Annealed and Galvanized Wire; Hard Spring Coil Wire; Twisted Cable Wire; Telegraph and Telephone Wire; Straightened and Cut Wire; Fence Staples; Poultry Netting Staples; Regular and Galvanized Steel Wire Nails; Coated Nails; Large Head Felt Roofing Nails; Bale Ties, and "Pittsburgh Perfect" Fencing, all produced in our furnaces and mills from the ore in our mines to the finished material.

GALENA OILS

HAVE NO EQUAL IN

VOL. LVIII. DECEMBER, 1914 No. 12

Important Developments in the Transportation Field

INTERSTATE COMMERCE COMMISSION GRANTS RATE INCREASE

By a vote of five to two the Interstate Commerce Commission has granted the application of the railroads in Official Classification territory for an increase in rates. The decision awards the carriers 5 per cent on everything but coal and iron ore, and is expected to add nearly $50,000,000 a year to revenues of the lines east of the Mississippi and north of the Potomac and Ohio rivers.

The only exceptions made are those which were expected by the railway managers. Increases on bituminous coal and coke were denied because of the recent investigation, as a result of which maximum rates were prescribed. The advances on anthracite coal and iron ore are not allowed, because they are before the Commission for review in other proceedings. Rail-lake-and-rail, lake-and-rail and rail-and-lake rates are not to be changed, because the carriers have increased the rates by water and so lessened the differences between the combination and the all-rail charges. Rates which are governed by unexpired orders of the Commission are not to be changed.

But, on the other hand, the railroads received an unexpected award in being granted permission to raise rates on cement, starch, brick, tile, clay and plaster in Central Freight Association territory. The Commission now allows these rates to be increased throughout Official Classification territory, although they were excepted by the decision of July 29 from the increases allowed in the Central territory.

The "Merry Christmas" which the Commission extends to the Eastern roads has almost none of the unpleasant qualities which were contained in two previous decisions. That the board fully appreciated the urgency of the situation created by the war, and to which attention was called by President Wilson in his letter to Frank Trumbull, following the visit to him of the committee of railway men, is shown by the dispatch with which an agreement was reached. The evidence was not put into the Commission's hands until October 30, and but 39 business days elapsed before the final proofs of the findings were formally signed.

The decision is almost a sweeping victory for the railroads, for not only are all of the increases allowed, but the Commission suspends its rule requiring the filing of new tariffs 30 days in advance of the date on which they are to go into effect in order to make the relief available at the earliest moment. The order authorizes the roads to put the higher rates into effect on 10 days' notice.

Chairman Harlan wrote a supplementary and dissenting opinion, in which he concurs with the majority of the board in the view that the roads are in need of more revenue, but takes issue with the way in which it is to be gained. He expresses the view that the carriers need more than a $50,000,000 increase in their net revenue, but says that they have not, either in the original hearing or on the reopened case, made any effort to show that the scale of through rates as measured by the 5-cent on first-class traffic from New York to Chicago is unduly low or that higher through rates would be fair. He still stands for the remedy proposed in the decision of July 29: A revision of rates and the ending of practices that are unremunerative.

Commissioner Clements was bitterly opposed to the award made by his colleagues, on the ground that the roads did not justify the advances. He regards this decision as overturning the approved practice of the Commission in previous cases and as opening the door to great abuses. "I am not aware," he says, "of any prior case in which the Commission or any court has held that the need by a carrier of money was itself proof of the reasonableness of a specific rate or body of rates increased to meet such need." Further on in his dissenting opinion Mr. Clements says of the stand taken by the majority:

"If the legislative authority of the Commission is as broad and unrestricted as this, then I must confess that I have gravely misunderstood the limitations upon our statutory authority as well as the constitutional power of Congress to delegate its executive power."

The Commission proposes to keep watch on the effect of the 5 per cent increase on revenues, and for that purpose orders the carriers to keep a report for each of the next two years of the additions made to revenues by the new rates.

ANNUAL MEETING AND BANQUET OF RAILWAY BUSINESS ASSOCIATION

The annual banquet of the Railway Business Association, held in New York at the Waldorf-Astoria on the evening of December 10th, was the occasion for one of the most representative gatherings of business men held during the year in that great metropolis. Captains of industry whose fame stretch far beyond our National borders were scattered throughout the vast assemblage, while Government officials and railway executives represented those conflicting factors in railway development which it is the hope of this energetic and enterprising organization to harmonize in such a manner as to leave unimpeded the full development of our transportation agencies.

While the banquet was fully as brilliant as its predecessors, there was an undercurrent of serious purpose, perhaps even more noticeable than at previous annual dinners. The railway supply business had passed through one of the leanest years in its history and while optimism ruled supreme, as appears always the case with this great fighting organization, there was, nevertheless, an evident determination to get at the root of the difficulty and to so definitely develop its cause as to leave no doubt in the minds of the general public as to where the responsibility rested, and what remedies must be applied.

In the discussion of these great questions of transportation, the Railway Business Association was unusually fortunate in being able to procure for speakers two leaders of men, one representing transportation, the other government; both recently chosen for great tasks, namely, Mr. Fairfax Harrison, president of the Southern Railway, and the Honorable Warren G. Harding, United States Senator-elect from Ohio.

Never have members of the Railway Business Association listened to more remarkable speeches from the standpoint of both brilliancy and logic and never have they shown a greater enthusiasm for, or a more harmonious endorsement of, the many strong points developed by both speakers. Perhaps what was most remarkable about these addresses was the fact that although one was delivered by a railway executive and the other by a newly-elected representative of the people, they practically agreed in all essential points and with them apparently agreed every man represented in the vast audience, which, in itself stood for millions of invested capital and the prosperity of millions upon millions of workers in every branch of commercial life. It was an occasion and demonstration long to be remembered, and one of the deepest significance, and it constituted one of the sharpest and most impressive demands yet made upon public regulators to cease from placing unfair restrictions upon railway operations and developments and to more promptly grant that relief so necessary to maintain the credit of these vast arteries of commerce and permit them to maintain and develop their plant.

Both speakers deplored the delay which has been so evident in all attempts to procure relief and both speakers clearly proved

George A. Post,
President, Railway Business Association.

Fairfax Harrison,

"Like the previous stage of irresponsible private control, the existing system of irresponsible, rigid and divided regulation cannot permanently endure."

the great danger which rested in a political form of railway regulation. The statement of President Harrison that the pendulum had swung fully as far on the side of restrictive regulation as it ever had on the side of unregulated railway abuse, brought forth a thunder of applause as did the statement of Mr. Harding to the effect that he believed it to be the opinion of ninety-nine of every hundred thinking people that the railways of the country were entitled to an increase of rates and would gladly see it granted.

George A. Post, who was again, and for the sixth time, elected president of the Association, presided at the banquet, and it is hardly necessary to add to the complete satisfaction of all present. His introduction of the speakers left nothing to be desired, and showed a thorough appreciation of the moral and mental qualities of the men referred to.

Mr. Harrison, who spoke first, was compelled to wait several minutes before he could be heard, so great was the enthusiasm evoked by his presence. An abstract of his address follows:

In the controversy between the owners of railroads and the representatives of the public, the pendulum has now swung to an extreme on the side of irresponsible public power as it had previously swung to an extreme on the side of irresponsible ownership.

The conception is that in the imposition of burdens, railroad companies are public concerns and subject to the public regulating power, but, in the matter of relief, are private property and not entitled to be considered from the standpoint of their public service.

The growth of commerce has injected the question of the regulation of commerce into the States' rights controversy as a factor of prime importance. An undue proportion of the time of the manager and his assistants is diverted from the duties of management to the calls for explanations and arguments before many different State authorities when all that is necessary might be accomplished before one central regulating body, An efficient management is a large factor in securing for, or continuing to, the public a low basis of transportation charges under existing conditions.

One of the most dangerous weaknesses in the system is its inability to give prompt decisions. If there is a legitimate and pressing need for more revenue, the power to authorize or to produce it must be capable of being brought into action at once. If economies must be introduced, the power of management must be capable of responding promptly to the need. If a change of policy is demanded in the public interest, the power to pass upon the question must be capable of convenient and prompt exercise.

First among the essentials is railroad credit. Even a conquering army feeds its prisoners. We need a system which will bring stability of service and credit as well as equality and fairness of treatment. It must be possessed of an authority coextensive with the subject to be regulated. Its powers must not be divided and scattered among a number of independent regulating bodies, many of them responsible to a part only of the public whose welfare is involved, all of varying outlook and influence in their conclusions by differing policies and often by clashing and conflicting interests.

Like the previous stage of irresponsible private control, the existing system of irresponsible, rigid and divided regulation cannot permanently endure. My present purpose is not to venture to suggest the solution but the source from which an acceptable solution must come. A solution is not likely to be accepted if the suggestion comes from the railroad manager, because he is still supposed to look at only one side of the question and to be controlled by a selfish interest. It cannot come from the mere politician, because of his temptation to keep the question unsolved as a means of easy political agitation and as a valuable asset for temporary political advantage.

The problem is a statesman's opportunity. He who solves it must be trusted by all the people. He must be above the suspicion of selfish motive. All the lessons of history must be at his command. He must be a profound student of human action and of human government. He must have power to impress his views upon his fellowmen. He must be able, with just an equal hand, to divide unto Capital and unto Labor its living.

He must be able to assure the public of the correction of abuses, the establishment of justice and the maintenance of facilities adequate for their needs, and he must be able to assure the private owner of protection of his just interests and of fairness to his just rights. He must be able to reconcile the people to his philosophy of regulation and the politician to the loss of a highly valued political asset. Is there a man among us who is capable of this?

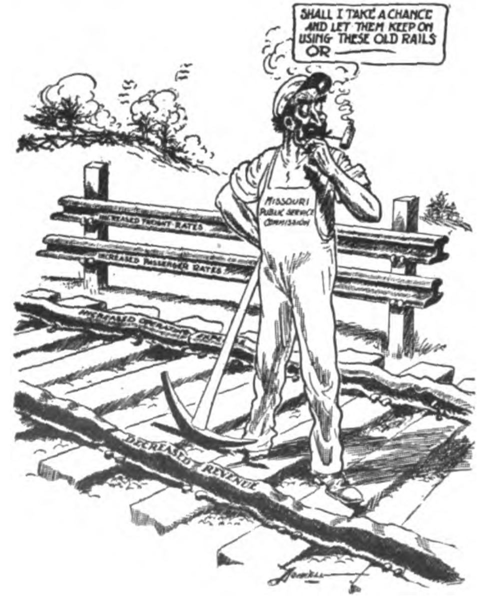
I venture to suggest that the present President of the United States is equal to this great achievement. The time seems ripe for him to undertake it. He has recently in an impressive way shown publicly a sympathetic appreciation of the railroad situation. The fact thus made evident, that he has grasped the point of view from which a solution of this problem must be approached, has aroused in the minds of many the hope that before laying down the reins of government he will propose and work out some constructive plan that will give stability to railroad investment and growth.

The people of the United States have called him to the leadership of this nation. They have entrusted him with their power. He has responded by noble public service. Is it too much to ask that he undertake this problem also and bring to its solution the wisdom and the power which he has already used so effectively in the public interest?

No ambition could be more worthy than to establish a "Constitution of Peace" among the variant views and interests which menace the success of the system of transportation. No service to his fellowmen could be a loftier or a finer service than to place this high interest of the people upon a sound, a stable and a permanent foundation.

I think I properly interpret the men now charged with the responsibility of railroad management when I say that they will welcome a solution of the problem, however it may differ from any preconceived views, and will meet any suggestion that may be made in a co-operative and a helpful, and not in a carping or obstructive, spirit. They are as anxious as the most public-spirited statesman for a just and final settlement of transportation controversies. When it comes to the consideration of any proposal, they may be relied on to put aside prejudice and pride of opinion, for they, of all others, are best aware of the imperative need of the railroads for an adjustment of all differences and for public approval, sympathy and support. Opposition must come from outside the railroad ranks.

The Problem of Safety First.



SHALL I TAKE A CHANCE AND LET THEM KEEP ON USING THESE OLD RAILS OR ——
MISSOURI PUBLIC SERVICE COMMISSION
INCREASED FREIGHT RATES
INCREASED PASSENGER RATES
INCREASED OPERATING EXPENSES
DECREASED REVENUE
Fowkes

SENATOR ELECT WARREN G. HARDING OF OHIO,

Who believes it is the opinion of ninety-nine out of every hundred thinking people that the railways are entitled to an increase in rates.

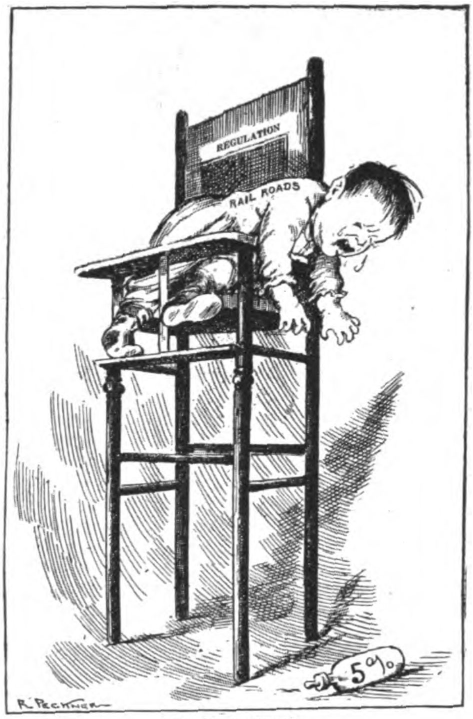
The greeting given Mr. Harding was fully as enthusiastic as that rendered President Harrison and one or two happy allusions at the beginning of his address, gave him at once the complete sympathy of his audience. He spoke in part, as follows:

The argument has never appealed to me that we ought to prosper our railroads for the specific purpose of promoting general prosperity. It seems to me more important to prosper our transportation lines as a simple matter of fairness and justice to this most important single agency in our modern lives.

I believe that the day of plundering financing has passed. I should like to proclaim, in the same breath, the passing of railroad-baiting less inspired by public good than by personal profits and political gain. It has been a great stunt to hammer the railroads.

The drift is toward the sober, second thought. There has been an excess of commissioning. The best railway knowledge in all the land ought to light the way. Public service ought to be the impelling purpose, unheeding public clamor.

I believe it is the opinion of ninety-nine of every hundred thinking people that the railways of the country are entitled to an increase of rates, and would gladly see it granted. Joseph proclaimed the warning to lay by an abundant store during the seven fat years in order to be prepared against the seven lean years. Egypt prospered wonderfully thereby. The wisdom of Joseph holds good to this day. American railways ought to be able to earn enough in the fat years to be



THE HIGH CHAIR.

—**From the *Financial America*.**

prepared to carry on their vast improvements in the lean years which inevitably come.

Under our present system of reduced and insufficient earning, and with increased cost of operation, there are no marked railway betterments except in the high tide of earnings, when cost is highest and improvements are hampered by traffic operations. We ought to reverse this order and provide an ample earning in good times to enable extensive betterment to be made in the dull period. This would tend to better service in the days of the revival. Meanwhile the expenditure for betterments would relieve the general dullness amid such conditions as we complain of to-day.

Through agitation and restriction, there has come impaired credit, until there is a threatened collapse of the railroad edifice. These items of maintenance and betterments have been overlooked by the political exhorters.

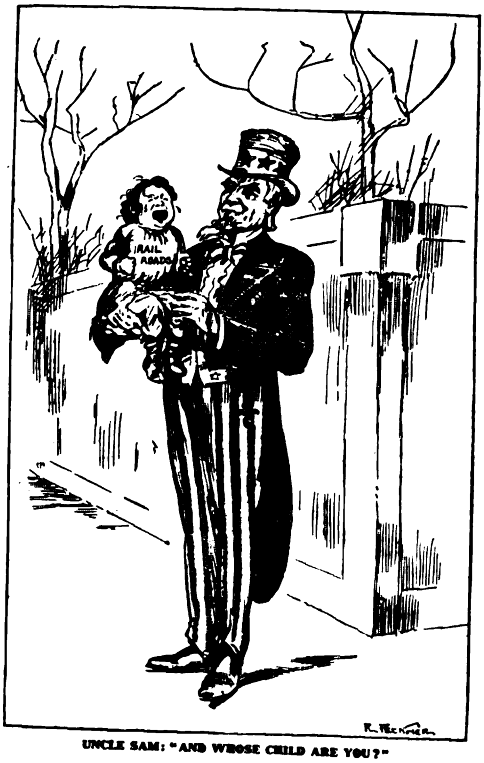
Perhaps the lack of successful regulation is due to the newness of the undertaking, to the unavoidable political agitation and to the harassment of conflicting authority because of varied State legislation and State commissions. We ought to put the entire railway service under interstate control. Such a policy would save millions in public expense and put us on a broad plane. The law making industry is too often worked overtime. The country needs to-day less legislative bills pending and more railroad bills of lading.

It is apparent that the Interstate Commerce Commission believes in the pressing necessity for increased earnings, but opposes the short and direct route. The rate increase would be direct and immediate. Other remedial efforts could be left to follow the slower process of evolved adoption. If the combined income from increased rates and added service charges made excessive earnings, contrary to public policy, the same authority which grants the increase could order a reduction.

Our American wage scale is twice to thrice that of Europe. Our rates of interest are generally higher. Our distances are greater and our population less dense. It would be natural for our railway transportation to be higher. Our freight rates are notably less, and our passenger rates only a trifle higher, and the service vastly superior. Yet on this very branch of business which costs the more in this country, the Commission recommends the increase which it is powerless to grant.

A general rate advance will not bring the complete revival of American activity, but it will save the crash of the temple of transportation, establish railway rehabilitation which is of prime importance in ministering to greater American activities. Governmental assistance in the hour of need will be new assurance that it is not the function or the purpose of government to destroy, but to foster and protect.

There are two things to commend to the public, to railway managers and to members of the Railway Business Association. One is simple honesty, the other is greater intimacy—the fullness of understanding between the railway management and the public served. There has been too much aloofness, sometimes a contempt for public regard. The minds which lead in making dependable public opinion mean to be fair, and need only to be informed. Railways have suffered needlessly because of the lack of public understanding. The public has an ear for the managers as well as the railway baiters, and the growth of favorable public opinion to-day is traceable to the fact that the railways have given their cause to public consideration. To mutual confidence add the unalterable honesty that makes for sincerity in politics, and we shall see a new era, which shall make a greater and swifter stride to our American astonishment of all the world.



UNCLE SAM: "AND WHOSE CHILD ARE YOU?"

While the banquet was the most spectacular part of the day's proceedings, the annual meeting held earlier in the day was, in many respects, no less important, as it is at such meetings that the campaigns of the Association are planned and the progress noted. President Post opened the meetings and briefly reviewed the Association's activities during the past six years. He pointed out the three-fold advantage which had accrued from their efforts, namely, the development of a closer friendship between railway supply men in general, the better acquaintance and readier sympathy between the railway official and the railway supply man and the instruction of the public along lines which will enable them to give a fairer and less prejudiced consideration of the problems which confront present-day railway management. Mr. Post was again unanimously elected president, and with him as vice-presidents were elected S. P. Bush, of Columbus; Alba B. Johnson, of Philadelphia; H. G. Prout, of New York; W. G. Pearce, of New York; Walter H. Cottingham, of Cleveland; W. B. Leach, of Boston, and E. B. Lee, of Chicago. S. M. Clayton, of New York, was elected treasurer. An abstract of the annual report follows:

We come to the end of 1914 confident that the developments of the year presage a broader and a more sympathetic public view of railway regulation. We believe this in face of perplexities discouragements and adversity. The fundamental ground for our optimism is the apprehension expressed from almost every quarter lest our country's business may suffer harm through inability of the railroads to perform their functions adequately by reason of inadequate revenues. A climax in the transformation of popular attitude has been reached. Foremost among numerous evidences of the fact is the veto by a large majority on referendum of an extra crew bill which the State Legislature of Missouri had passed and the Governor had signed. To-day the outstanding phase in the general thought is apprehension lest injury be done to the railroads, and hence to those whom they serve as well as to their owners, tens of thousands of whom are dependent upon them for dividends and to their employes, aggregating more than 1,700,000, who cannot escape serious damage in the long run if the growth of the industry is artificially retarded.

Effectuation of the popular mandate in the form of governmental action will take time. The process is complex. Adapting institutions to new conditions is a slow evolution in a country where the people rule.

It was necessary first to develop agencies for analysis and statement of the facts in form for busy men. Individuals who early appreciated the situation had to find ways for explaining it to their neighbors. This process has been successfully carried through.

Freight rates, though only one side of the problem, have been the occasion for proof of public feeling. The advance sought in 1910 was opposed by the shippers solidly organized, as well as generally by the press. Subsequently the general situation was discussed in communities by their leading citizens. When advances were again sought in 1913 the press had become almost unanimous in favor of permitting adequate revenue, and not a single business organization located in the territory was entered in opposition to the general advance as a whole.

Public officials have, as the next step, to be made acquainted with public sentiment and enlisted in the quest for remedies. Many political leaders, including the President of the United States, now frankly acknowledge the urgency of comprehensive action. Multitudinous questions press for the attention of every public man. To command the aid of political leaders in every part of the country will require that constituents persistently keep the railway problem to the front.

Certain obligations rest on particular responsible agencies:

The law-making body, which is temporary and chosen for miscellaneous purposes, should avoid dealing with details by statute and give a general rule of guidance to a commission, which is permanent and selected for a specific purpose. This applies to rates, service, labor conditions and safety provisions.

Extra crew laws should be repealed. Some method should be developed to prevent strikes under threat of which, regardless of financial ability of the companies to comply, higher wages and costlier conditions are invariably awarded; for labor cost can attain levels which will not only injure the public, but defeat the purpose of labor by retarding the growth of the industry and hence of employment in it. Labor can help itself and the public, too, by cordial co-operation in efforts for economy. Proposals to compel expenditures for any purpose should be rejected unless absolutely necessary. State governments should not seek immunity from economies by piling taxes upon railways as if that source of public revenue were inexhaustible.

Beyond and above these particular phases, the situation imperatively demands co-ordination of regulatory agencies, so that each may be guided by knowledge of what the others are doing. Conflict between Federal and State authorities is in process of mitigation through Supreme Court decisions, but State commissions have this year forbidden railroads to put into effect tariffs prescribed by the Interstate Commerce Commission, and there is no provision for conference or co-operation between these divergent masters whom the roads must serve. Neither the Federal Government nor any State imposes upon any one authority or fusion of authorities power or duty to consider the relation between compulsory expenses and regulated rates.

To sustain railway credit by permitting general rate advances has never been a function performed directly by Congress, and we hope that body will always leave such matters to permanent commissions. Sanction for an increase to meet the deficiency of income which the Interstate Commerce Commission has found to exist would strengthen earnings and credit would then take care of itself. The Commission has explicitly considered as an element in reasonableness of rate fabrics the ability of the average road in in each regional group to command new capital and enlarge its facilities with the growth of the country. Rate advances have been denied in some cases on the ground that credit was not in danger and granted in other cases on the ground that it was in danger.

But not even possession of power to permit rate increases or prompt and liberal exercise of the power is enough. Cost of operation is continually rising through acts of Congress and of the State and of the wage abitrators. Rates cannot be advanced indefinitely to meet such expenses. The rate level would eventually reach a point where the traffic would not move, and the higher rates would produce less revenue instead of more, while stunting the growth of industries and of regions. Somewhere in our system provision must be made to show every year the estimated revenue and the estimated expenditures, and bring about by definite co-operation or reconcilement of these accounts, with provision of surplus for the average road.

Accomplishment of this result is the task of statesmanship. That task was second to none before the European war and the effects of that conflict upon American business have made the railroad question still more pressing. It is for those engaged in transportation and in business to co-operate with political leaders in a spirit of confidence, of candor and of reciprocal open-mindedness. The people of the country are determined that the issue shall be dealt with. It is the obligation of the public in general to emphasize at every opportunity the earnestness of that resolve.

The following resolutions were unanimously adopted before the closing of the annual meeting:

I. We again urge co-ordination of the various agencies of railway regulation. One of the most serious embarrassments under which the Interstate Commerce Commission labors is that it cannot enforce its findings when they conflict with State action. Until some permanent and satisfactory solution is reached, the Federal Commission should initiate and State commissions should join in conferences, exhausting all reasonable efforts toward co-operation. The country should consider its transportation problem not piecemeal but as a whole, with a broad outlook on the general prosperity. The financial condition of the railroads ought to be made plain to every public officer and no burden placed upon the railways without due consideration of the effect upon their net income.

II. We regard general rate advance cases as a proper subject of propaganda. As a matter of public policy the people have a vital interest in strengthening railway credit. They have the right to express their opinion and to promote public discussion.

III. We vigorously dissent from the view that the supreme concern of railway regulation is to avoid the risk of too much railway revenue. In business and in the affairs of government, what men dread is not a surplus, but a deficit. The railroads should be put beyond reasonable doubt of having enough income. It is now known on the highest authority that their income is too low in the public interest. Various substitutes are proposed in place of advances in freight rates as a remedy. It has been demonstrated that some of these suggestions are not immediately practicable. Certain relief should be granted forthwith. National prosperity depends upon it. The people cannot afford mistakes on the wrong side of the ledger. Any superfluous surplus can be dealt with when and if it materializes.

IV. Underpayment of railways for carrying mail demands correction. Quadrennial weighings result in substantial increases in service performed without added compensation. The initiation of the parcel post service without adequate remuneration to the railroads aggravates this discrepancy. This inequity should be minimized through a change to annual weighings. Instead of this, the House has passed and the Senate is considering a method of payment based on advance estimates of car space to be used. We oppose this experiment. It prescribes no method for measuring space actually used, no check-up of estimates by actual measurement, no way of proving whether the space authorized approximates that furnished. The computation of mail pay should be on a basis of ascertained facts so far as practicable, and all findings of the Post Office Department should be subject to review by some less interested arm of the Government.

V. Federal regulation of railway security issues would be an advantage if it did away with regulation by States. Super-added to State supervision, it would further confuse and harass the roads in their financing, already made complex, cumbersome and slow by multiplicity of masters. Inasmuch as authorities differ as to what can ultimately be done, we advocate that Federal action be confined to publicity, as recommended by the Hadley Commission.

VI. President Wilson by his sympathetic reception of railway executives and his generous response to their plea for public co-operation has shown that the time has come when political leaders are willing to listen without prejudice to appeals on behalf of the carriers. Members of our Association can do effective work in arranging conferences with governors, State legislators and members of Congress. The more open and public such meetings are the better.

VII. We congratulate the people of Missouri on the veto of the extra crew bill. In most States railroad commissions have ample power to require safety precautions according to actual circumstances, which vary from time to time and from road to road. Details should be left to regulation. Needless men promote danger rather than safety, and their compulsory employment is a waste of money collected from the rate payers. In those States which have extra crew laws our Association will advocate repeal.

VIII. America has lagged too long behind Europe in protecting against himself the person who risks life and limb by trespassing on the railroad right of way. Our laws are loose, our enforcement lax, the result a yearly toll of awful magnitude. We favor absolute prohibition of trespassing on railroad property under heavy penalties, and rigid severity in dealing with offenders.

THE OUTLOOK AS VIEWED BY PROMINENT OFFICIALS

A number of railway officials have recently expressed themselves in the public press with reference to the railway outlook. While in most of these expressions there is an apparent desire to make the best of things, the outlook is far from satisfactory. President William Sproule, of the Southern Pacific Company, states that:

> The condition of the railroads generally is a serious problem to be faced and the opening of the Panama Canal and the diversion to the canal of business the railroads have hitherto enjoyed adds to its perplexity. The problem of railroad earnings is rapidly becoming a public one, for unless the railroads can make liberal earnings to maintain their credit, so they may get new money to make improvements and extensions, responsive to the business of the public, it is the public who will suffer. The public will suffer because there will be no field of expansion into which the general business of the people can develop, and further, if business should, within its present bounds of distribution, boom again as it did in 1904, 1905 and 1906, there will be such a congestion of railroad facilities in the country as will stop the boom by congesting the business of the public and preventing that kind of material improvement and development which every man of business, large or small, is looking forward to for his salvation. For example, the railroads are not ordering equipment in any considerable quantity because they cannot pay for it. In every way they have had to shrink their expenditures. What this nation needs more than anything else is a soundly informed and constructive public opinion, instead of the destructive criticism which destroys confidence and helps to make hard times. Bad methods of a few should not bring censure on all.
>
> With public opinion directing itself toward helpful methods of building up the general business we will have constructive statesmanship which is the crying need of the time regardless of party or party names.

President Rea, of the Pennsylvania Railroad, with a party of directors and officers recently returned from an inspection of the system and made the following statement with reference to the present situation and what, in his opinion, is the principal remedy needed in order to bring back a more general condition of prosperity:

> Business is depressed and railroad earnings continue to fall materially as compared with last year. As a result, many men are out of work, train mileage and shop operations are curtailed and purchases of materials and supplies are reduced to a minimum.
>
> This enforced economy on nearly all railroads means very many millions lost to manufacturing and business establishments.
>
> There is an eagerness among all classes for some action by the Interstate Commerce Commission, and the hope is generally expressed that the Commission will help the railroads.
>
> The belief is widespread that such constructive action by the Commission would restore confidence and that it would turn the tide of business uncertainty now that the Government has established the reserve banks and measurably provided for carrying this year's cotton crop.
>
> It is felt that the Government is doing a great deal to stimulate business, but that the condition of the railroads is still the chief drawback to manufacturing and commercial activity, and that this serious obstacle can be removed by promptly allowing freight rate increases.

Julius Kruttschnitt, chairman of the Executive Committee of the Southern Pacific Company, in his annual report for the fiscal year ending June 30, 1914, recently made public, has the following to say, in part, regarding the heavy decreases in railway revenues:

> The large decrease in passenger and express earnings is attributable to deferred travel in anticipation of the California expositions and numerous expositions to be held on the Pacific Coast in 1915; the diminished transportation of labor incident to the postponement of new enterprises; the curtailment of excursion, tourist and commercial travel by enforced economy; increased competition of interurban electric lines and motor vehicles; and reductions in express rates by the Interstate Commerce Commission and the Railroad Commission of California, which became effective in February and March of this year.
>
> Notwithstanding the yield of normal crops in sections served by these lines, there has been a decrease in gross freight revenue of $1,772,084.76 due to a substantial curtailment of shipments of forest products in Louisiana and Texas, resulting from the inability of the railroads to make the usual purchases of cross-ties and from the postponement of other new construction requiring the use of lumber; the previous completion of electric power, water supply, irrigation and pipe line construction in California; and the extremely conservative purchases of merchandise.
>
> Reduced rates compelled by influence of Federal and State commissions which were in effect

JULIUS KRUTTSCHNITT.

> during last year and were not in effect throughout the previous year resulted in a shrinkage of at least $500,000 in the gross revenue of these lines, and it is conservatively estimated that cumulative reductions of this character during a period of four years ending June 30, 1914, decreased the gross revenue of these lines by at least $4,000,000.

In a recent letter to President Wilson Charles Francis Adams, who was formerly president of the Union Pacific and for seven years chairman of the Massachusetts Board of Railroad Commissioners, spoke of the dangerous trend in recent railway developments particularly in New England, and summed up his opinion of the general situation in the following words:

> I am clear in my conviction that an inquiry by any reasonable, intelligent and judicially minded tribunal would develop the fact that the return on traffic received to-day is, as a whole, not sufficient fairly to remunerate the capital already invested—far less, in the case of the Eastern New England System, to pay interest on the hundred million additional capital undisputably required for immediate development.
>
> From this situation, I further admit, there is one possible escape only. The community in its own interest, and in order that it may not find itself put out of business and in physical jeopardy, must submit to pay for the service it requires what the service required is reasonably worth. This, to-day, it is not doing.

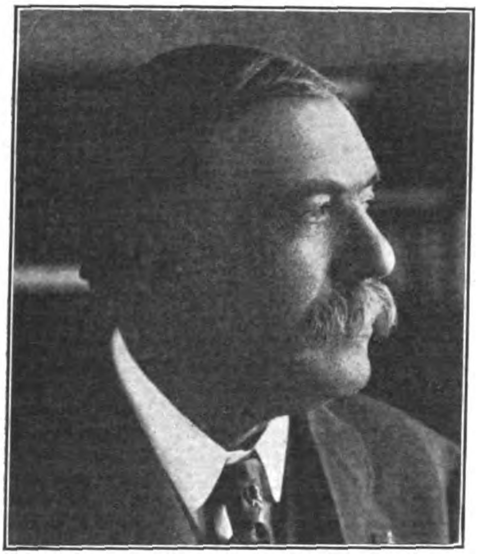
John J. Mitchell, president of the Illinois Trust and Savings Bank, is another prominent financier who has called attention to the necessity of a more liberal attitude towards the carriers. In a recently published statement he said:

> There is every logical reason why the Commission should allow the railroads the right to advance their freight rates and there are no reasons other than political why the carriers should not be allowed the relief in the present emergency. The banks of the country came to the relief of a distressed financial situation, and it is beyond their power to help the railroads if the Government will not make it possible for them to do so.
>
> The largest shipping interests in the country are not opposed to paying more for transportation of their products. They know that the railroads must have more revenue to offset the enormous increase in their operating expense, and they know that if the carriers do not get this it will only be a question of a short time when shippers must suffer the consequences in the form of curtailed transportation facilities.
>
> The Interstate Commerce Commission's advisers are beating tom-toms to attract attention of the public. There is too much politics and too little application of scientific principles in handling these matters, which are widespread and vital in effect.

Ivy L. Lee, executive assistant of the Pennsylvania Railroad, in an address at Indianapolis on December 15th, before the Economic Club of that city, made the following statement:

> There are four fatal defects in our present method of treating railroads:
>
> (1) We act as if every railroad stock was watered, as if every railroad was plundering the people—neither of which we really believe to be true; and we forget that when we invited private capital to build railroads we impliedly promised them fair treatment.
>
> No one could seriously maintain that we could have obtained the money to build our matchless transportation system, if investors could have anticipated the treatment they have received. The remedy is common fairness.
>
> (2) We act as if our railroad system was complete, and as if we did not have to offer any inducements to the world to provide out of its savings the money with which to extend and improve our railroads of the future.
>
> Private capital is timid, and it goes wherever it is treated best. If our country is not to stand still, if the people are to have adequate railroad service in the future, we must take thought for the morrow.
>
> (3) The States hopelessly conflict with each other and with the Federal Government in their demands upon railroads, to the continuous embarrassment of the railroads. This Government of ours was organized to abolish customs barriers between the States. There was no thought of railroads then. But now through State regulation we allow to be erected a barrier to free trade between the States quite as effective as the customs tariffs of Colonial days. The trade of our people is one; the problem of transportation for our people is one, and should be dealt with by the nation for the people as a whole.
>
> (4) Railroads are essentially business institutions. Their problems are business problems. The successful business man must act quickly, he must adjust his affairs promptly to changing conditions. We have developed a system of regulation, however, which clogs in its slow movement, instead of facilitates, the movement of the machinery of trade.
>
> The decisions of regulating boards come too slowly. If regulation is to be a success, some plan must be devised whereby decisions one way or the other shall be rendered promptly. The doctor must act speedily if he is to save the patient; autopsies are interesting and valuable, but they are too late.
>
> The people should regulate the railroads, but regulation should not mean repression—it should mean help and construction.
>
> It should not mean strangulation, but a guarantee of health and strength.
>
> It should mean co-operation between the public and the railroads for the mutual advantage of both.
>
> Everybody uses the railroads. The railroads are, as the President says, "the one common interest of our industrial life." The railroad problem is the people's problem.
>
> The wrong solution means stagnation and economic sterility; the right solution means a continuance of our material and industrial welfare.

The effect of governmental regulation upon the railway industry is discussed by



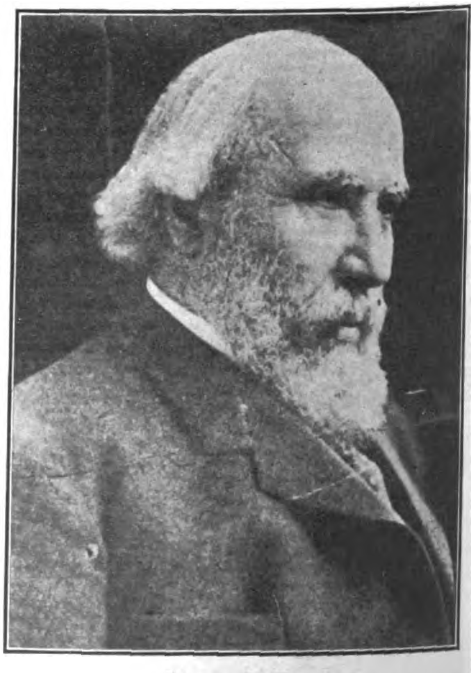
E. P. RIPLEY.

President Ripley, of the Atchison, Topeka and Santa Fe, who states in his annual report to stockholders recently made public, that:

> Your directors feel that heavy responsibilities devolve on them in the present state of governmental activities directed at the railroad industries. It has been found almost impossible to make even an approximate estimate of the cost of "regulation" which has been imposed on us by the State and National governments. Without criticizing the policy of proper supervision, it is fair to say that many of the laws are not only expensive, but, in the opinion of your officers, unnecessary and superfluous. Constant whittling of rates, plus constant legislation which adds to your expenses without adding to revenue, have had their inevitable effect. Your own company has been less crippled by these conditions than some of those less fortunate, but by reference to page 14 (income account) it will be seen on how narrow a margin we have been working. There are some evidences of a disposition on the part of those in authority to realize that great injustice has been done in the guise of regulation and that it is time to call a halt, but the relief which the railroads need cannot come until this disposition shall be transmuted from mere expressions of friendliness into positive remedial measures. General words of sympathy will accomplish nothing if governmental agencies continue in each specific instance to impose additional burdens or to find excuses for not granting specific relief. Hence your directors deem it their duty again to warn stockholders that their interests are more endangered by the various governmental regulations than from any other source.

James J. Hill discusses the railway situation at length in a recent issue of a paper published by the Business Men's League of St. Louis. He calls attention to how credit has been strained by the war developments and how the future will see both cash and credit in the United States as elsewhere, command higher rates and be more difficult to obtain than within reecnt experience. He shows how farming, the largest single industry will suffer least of all under such conditions, and how other interests through governmental association are being placed in a position to weather the storm. He shows that while greatly inferior industries are being helped in every possible way, nothing has been done for the railways yet, as he points out, without the railroad, without its unimpaired service and its constant extension and improvement, neither the farmer, merchant, manufacturer nor consumer can prosper. To quote from the article:

> It should be obvious to everyone that the railroads must be so treated that they can at least earn in part and borrow in part the vast sums which they are going to require. Unless they can earn, and earn more liberally than in the past, they could scarcely borrow even in such a market as that of the first six months of this year. In the financial market created as a consequence of this war, they will not be able to borrow at all, or only on unfavorable terms and to a limited extent. With pressure upon them from all sides for more wages, more taxes, more facilities, more kinds of costly service and more money to pay the salaries of State and National agencies charged with the never-ending task of investigation and inquisition, they cannot even maintain the unsatisfactory rate of earnings of their recent past. This is not the argument of an advocate for a cause; it is the conclusion drawn from official facts.
>
> With the new stimulus which our people reasonably expect after peace is established, the new



JAMES J. HILL.

markets to be satisfied, the new demands filled, all involving additional demands upon the carrier, his machine will break down hopelessly unless it can be made more adequate. That can be done only by securing the investment of enough capital. It could not be done to-day if the supply of capital and the demand for it stood relatively as they did six months ago. To imagine that it can be done when there is such a poverty of available capital as there will be for ten, twenty, possibly more years to come, is absurd.

What are likely to be the effects at home of conditions which surely approach, if no preventive is provided? There are probably $15,000,000,000 to $16,000,000,000 of American railroad securities held at home, and from $3,000,000,000 to $5,000,000,000 held abroad. What must happen to these securities if nothing is done?

To look only at the probable action of the foreign holder, so soon as the exchanges are opened once more, what is he likely to do with property averaging him a return of 4 or 5 per cent, in another country, when the reconstruction of industry at home is calling for all available capital at a much higher interest rate? What is likely to be the effect upon the railroads, upon the credit of the country, upon the gold supply and the whole financial system, if the holders of these securities are virtually compelled, as sound business men looking for the highest average rate of profit, to dump any such quantity of their holdings upon the markets of the United States? What must be the effect upon business, credit and banking of so profound a disturbance in the basis of such an enormous financial and industrial interest?

I have stated in outline the main facts of the after-the-war situation as it relates to the railroads. Through them it relates to every business and to every family and every man in the country.

The railroads require a loosening of the bonds which even in ordinary times clasp them so tightly that they cannot give to the public the best service of which they are capable. It needs no reversal of general policies, no unsettling of the relation between the railroads and the Government, but an agreement upon just two things: First, a general permission to all the railroads to advance rates, if they find it necessary, to not to exceed a certain per cent of the rates at present in force; second, the assurance by common consent of the leaders of public opinion and political action that there will be no more legislation restricting railroad activities, lessening receipts or increasing their expenditures.

The magnitude and the urgency of this matter have not yet impressed themselves duly upon the people of this country. They have been too stunned by the awful and unexpected spectacle abroad, too absorbed in the progress of the most terrible event in history, too involved in study of the immediate consequences which had to be faced almost in the day that they were born, to realize the railroad situation in the new light thrown upon it by the lurid flames of conflict. But it cannot be relegated to a later time or an inferior place.

The railroad is the sap of the industrial tree. It is the speed regulator of industry. It is the thermometer of credit. Its stability, its prosperity, its ability to confront with confidence a totally new era in the capitalistic and credit conditions of the world, must be protected and assured. No duty devolving upon those who sit in the watchtower of the world while nations sway and fall below them, studying how to guard ourselves against the calamities that their ambition and hate and faith in force threaten to send on us as well as on them, can take precedence of this.

A SHAMEFUL RECORD

The record of Congress and the Post Office Department with reference to properly compensating the railways for carrying the mails since the installation of the parcel post, is little less than shameful. At the present time the railways of the country are carrying approximately half the parcel post without payment of any kind, and in addition are underpaid for the carriage of the balance of the mail matter.

Efforts have been made, but apparently with little avail, to procure a fair consideration of this question and an exhaustive investigation by a Congressional committee specially appointed for this purpose, has shown that the present rate of pay for this service is below what it should be.

In spite of these developments and the favorable opinion of the press of the country, Congress closed its recent session without providing adequate relief, and the railways have as yet received no assurance that relief will be granted during the present session.

In a letter to Mr. Frank E. Noyes, manager of the Parcel Post News with headquarters at Marinette, Wis., the Honorable William H. Taft, had on October 2, 1914, the following to say with regard to this particular feature of the parcel post development:

> There is one thing connected with the parcels post that ought not to meet the approval of anybody, and that is that we have not given to the railroads appropriate compensation for the additional burden that they have to carry by reason of the parcels post, but after a time Congress will see its duty and make reparation in this regard I hope.

Mr. Taft regards the parcel post as a great step forward in the methods of cheap transportation for the people, but like all other fair-minded persons, he desires to see the railroads properly compensated for the additional work which it involves.

In its issue of November 19th, the Philadelphia *Public Ledger* asserts that, "The profits of the parcel post, in fact, come out of the pockets of the railways, which are transporting mail matter of this sort at ruinous rates," and the Pittsburgh *Gazette-Times* of November 11th, affirms that "A square deal is required by the Government in the transactions of citizens or corporations doing business with it, but for years it has been persistently regardless of the obli-

William Howard Taft.

Who believes the railroads have not been as yet, granted appropriate compensation for the additional burden imposed upon them by reason of the parcels post.

gations to be fair with the railroads in the matter of mail transportation."

The following statement just issued by the Committee on Railway Mail Pay and which briefly reviews developments since the installation of the parcel post clearly indicates how grossly unfair the present methods are:

> When the parcel post was established on January 1, 1913, no provision was made to pay for its transportation. As a result, the railroads carried the entire parcel post for the first six months without any payment whatever.
>
> Meanwhile, the mails were weighed on the railroads in the Middle Atlantic States, and on July 1, 1913, the mail pay of those railroads was increased to compensate them for the weight of parcel post then being carried.
>
> Six weeks later, the weight limit per parcel post package was raised by the Postmaster General from 11 to 20 pounds, and on January 1, 1914, to 50 pounds. The postage rates were lowered. For the additional traffic created, the Middle States railroads have not been paid and are carrying for nothing all packages above 11 pounds weight.
>
> Last spring the mails were weighed in the far West and the increased pay found to be due was awarded to the railroads of that section, beginning July 1, 1914. These are the only railroads in the country now being fairly paid for carrying the parcel post.
>
> In densely populated New England and the Middle West, and in all the Southeast, the railroads are still carrying the parcel post without pay, have for certain arbitrary allowances, in no case exceeding a five per cent increase in mail pay and ranging down to a fraction of one per cent, which Congress permitted the Postmaster General to make at his discretion.
>
> Actual weighing of the mails elsewhere showed that proper increases would have been 20 to 25 per cent.
>
> Nearly two years have now elapsed since the establishment of the service, yet approximately half the parcel post is to-day being carried by the railroads without payment. Results shown in the cases where the increased weight of mail has been properly ascertained indicate that in the present year, alone, the railroads, as a whole, will thus lose upward of $8,000,000.
>
> For this injustice the cause lies in the Post Office Department's practice of weighing the mails and readjusting railway mail pay only at four-year intervals, one of the four "mail contract sections" into which the country is divided being covered each year. Every railroad, after receiving an adjustment of pay, is required by this system to carry the increase in the mail tonnage for four years without compensation.
>
> In an appeal for fair play, the railroads, through the Committee on Railway Mail Pay, have joined in asking Congress to require by law that the mails shall be weighed throughout the country at least once a year, and the railroads paid for the annual increase in the weight of mail carried. Simple justice long ago required this reform. The parcel post has made the need doubly urgent.

The Committee on Railway Mail Pay has made a direct appeal to Senator Bankhead, chairman, and the members of the Senate Committee on Post Offices and Post Roads, urging action to assure the railroads fair compensation for carrying the mails. The appeal, in part, is as follows:

> After two years of most careful inquiry, the Joint Committee on Railway Mail Pay, under the chairmanship of former Senator Bourne, established three fundamental facts:
>
> 1. That the railroads as a whole are underpaid for the service of carrying the mails by not less than $3,000,000 per year.
> 2. That in addition, the railroads are required to perform important auxiliary services, distinct from actual transportation, for which no payment whatever is made.
> 3. That these conditions (resulting in general underpayment) are due to certain specific defects in the present system.

The statement points out that the railroads now lose over $9,000,000 per year through the system of weighing the mails only once in four years, and the nonpayment for various terminal and transfer services and for apartment car distributing space.

> How then should this underpayment be rectified?
>
> The railroads suggest that the general condition of underpayment, found by the Bourne Committee, be remedied by providing for the following:
>
> 1. Annual weighing of the mail.
> 2. Payment for, or relieving the railroads from, performing side, terminal and transfer service.
> 3. Payment at just rates for apartment car distributing space.
>
> Correcting the foregoing specific details of underpayment would accomplish these results:
>
> 1. Remedy the present injustice toward the railroads, and at the same time build for the future upon the basis of known experience in the past.
> 2. Provide an automatic plan for paying for the rapidly developing railway mail service.
> 3. Remove opportunity for friction or misunderstanding between the Post Office Department and

the railroads, thereby increasing the efficiency of the Post Office Department and placing at the disposal of the Government the whole-hearted cooperation of the railroads in developing the postal service.

It seems to us that such a plan will violate no one's sense of justice, and will embody the greatest amount of practical statesmanship.

It is almost incomprehensible, in view of the above facts that the Postmaster General should, in his annual report, which was issued the second week in December, congratulate the Department and the country on the fact that for the first time in its history the Post Office Department was self-supporting. As this surplus is largely, if not entirely due to the fact that the railways are receiving practically no compensation for the enormous tonnage carried under the development of the parcel post, the revenue from which is really responsible for the surplus to which the Postmaster General refers, his statement is little short of outrageous and violates utterly the principle of American fair play. Under the circumstances, the least the Postmaster General could have done would have been to call the public's attention to the fact that this surplus was due to temporarily abnormal conditions under which the railways were not being fairly compensated for carrying the mails, and that the Department was making every effort to develop effective measures by which this injustice could be speedily rectified.

On December 15th, Mr. Ralph Peters, president of the Long Island Railroad, and chairman of the Committee on Railway Mail Pay, issued the following statement:

Without giving the railroads the opportunity even to ask for a hearing, the House of Representatives Committee on Post Office and Post Roads has reported the post office appropriation bill, carrying as a rider the provisions of the Moon bill for changing the basis of railway mail pay, and is seeking to secure from the Rules Committee to make the new legislation in order.

Passage of this legislation will have the certain result of compelling the railroads to carry the parcel post at ruinously low rates—in many cases for less than is earned in hauling the lowest grade of freight.

Postmaster General Burleson, in his annual report just submitted to Congress, expresses the desire to see the railroads fairly paid for carrying the parcel post and the general mails. We appreciate his good intentions, but unfortunately the adoption of the Moon bill plan of payment will have an effect exactly the opposite of that of which he speaks.

The railroads will lose this year not less than $8,000,000 in carrying the parcel post, by reason of the compensation received falling at least that much short of covering the service rendered. The mail pay provisions which have been injected into the post office appropriation bill will inevitably increase this underpayment, by reducing the scale of pay for transporting the parcel post and all other classes of mail.

The small roads will be the greatest sufferers. They are already most inadequately paid for carrying the mails and will, according to estimates made by some of their officers, suffer a cut of 25 to 65 per cent additional, if the plan of payment embodied in the post office appropriation bill is passed.

There is neither need nor justification for legislative experiments with railway mail pay, and the Moon bill plan of payment is purely experimental. If Congress wishes to assure the railroads fair pay for carrying the parcel post and the other mails—which we cannot doubt—it is a simple matter to do so.

Let Congress retain the system of paying the railroads for the weight of mail carried, but provide that the mails shall be weighed not less often than once a year, instead of only once in four years, as at present. Mail pay will then keep reasonable pace with the increase in the service rendered, instead of lagging years behind. Justice will be done both to the Government and to the railroads.

THE SAFETY OF UNITED STATES RAILWAYS

For many years, until railway accident figures were subjected to classification and study, it was the general belief that the railways of the United States were exacting a frightful toll of human life on account of lack of proper precaution and safeguards in the operation of trains.

When, however, the railways began to subject their accident figures to a careful analysis, it was found that railway travel instead of being unduly dangerous, was in reality, one of the safest of all methods for getting from place to place, and furthermore, when a fair comparison was made with railway accidents in other countries, the United States' railways were found to be among the safest in the world.

Casualties on American railways have been and continue to be very heavy, and far beyond what a reasonable precaution should make them. When it is considered, however, that the great bulk of railway accidents occur, either in connection with trespassers or from the acts of individual employes who generally personally suffer the results of their own carelessness, it will be appreciated that a very small proportion of the total deaths and injuries can be placed at the doors of responsible railway officials or to the methods and rules under which the railways are operated. As a matter of fact passenger casualties are remarkably small and a large proportion of them are due entirely to the carelessness of the passenger injured or killed.

Since the inauguration of the safety movement, constant improvement has been noted in the safer operation of trains both with regard to freight and passengers, which has led to a most encouraging reduction in the loss of life and in the destruction of property. As the United States railways stand to-day, taken as a whole, they undoubtedly represent the safest and most efficiently operated system of any nation of the world.

That other countries are having their trouble in avoiding accidents which lead to the loss of both life and property, is indicated in an address delivered on December 8th at Montreal before the members of the Canadian Railway Club by Mr. Alfred Price, assistant general manager of the Canadian Pacific Railway. Mr. Price's subject was, "Some Maximums and Minimums in Train Operation." His references to freight losses and personal injuries, however, present a good illustration of the difficulties encountered by the Canadian roads in safely operating their trains. Referring to the results for 1913, Mr. Price states as follows:

> Last year the Freight Loss and Damage Account of the Canadian railways amounted to over $2,000,000, a sum double the amount paid out in 1911. The shipper wants the goods delivered to the consignee intact, and would gladly waive the $2,000,000 he now receives to have this done. This sum therefore, may be regarded as a penalty imposed upon the railway for non-fulfillment of an obligation or contract. The railways are almost entirely responsible for this loss. The waste can be stopped by the adoption of up-to-date methods and insistence upon the exercise of greater care on the part of agents, billers, checkers, porters and trainmen.
>
> For clearing wrecks and satisfying claimants on account of injuries the Canadian railways paid out last year over one and one half million dollars. There were no less than 710 people killed by the movement of trains, besides 2,966 injured. It is quite true that almost half of those killed were trespassers, and we are likely to continue to have a harvest of deaths from this cause every year until there is a law making trespassing a criminal offense, and a severe penalty is imposed for a violation. Most of the other fatalities and injuries might have been avoided by the exercise of ordinary care. What is needed more than anything else is increased safety in railway operation. One dislikes to speak of the loss in dollars and cents in the face of the awful loss of life and limb as a result of these accidents. The figures quoted tell their own pitiful tale in terms needing no emphasis. The Safety First Campaign is doing a grand work, and is entitled to the sympathy and active help of every railroad officer and employe.

THE TRESPASSING EVIL

Much has been said during the past two or three years regarding the trespassing evil and the laxity on the part of Government officials in the enactment of laws or the enforcment of those already on the statute books, in such a manner as to improve existing conditions. The slaughter goes merrily on, however, and those in authority appear to take no steps to stop the annual killing of thousands of useful American citizens, to say nothing of the large number of little children who lose their lives in a similar manner. Even those roads which have made a special effort to eliminate this evil have become almost discouraged over the apparent careless indifference of public officials whose co-operation is necessary before any improvement can be made.

A pamphlet recently published by George Bradshaw, a well known safety first expert, pathetically illustrates the disastrous effect of permitting minors to play in railway yards or upon the right-of-way. This pamphlet contains a story of a small boy, by name Fred Warren, written by himself, who, in attempting to jump upon a moving freight car, lost his balance and had his leg crushed beneath the passing wheels. Of course amputation was necessary, and when the little fellow returned to active life, crutches were necessary and will no doubt

George Bradshaw.

be his constant companion for the balance of his life. His pathetic tale of how his entire life was changed and how all those active outdoor sports in which the heart of the young boy delights, had to be forever abandoned, should in itself, provide the necessary incentive for those in authority to do everything possible to avoid future occurrences of this character.

The teacher of the boy also has a short article in the same pamphlet in which she points out among other things, that during the past three years, there were more railway trespassers killed in the United States and Canada than in the War of 1812, and she pertinently adds that while those in the War of 1812 died fighting for the flags of their countries, the others died doing what they had no right to do and and no good reason for doing.

Mr. Bradshaw closes his pamphlet with a problem, the solution of which is of interest not only to railway officials but to every citizen who objects to the useless taking of human life. It should appeal particularly to public officials who appear to be so indifferent on this subject. The problem as presented by Mr. Bradshaw is as follows:

> Trespassing on railroads has become a national evil. Armies of men, women and children are being killed and maimed, from an unnecessary risk, and not a hand is raised to stay the slaughter. The railroads are practically powerless in the matter. Only an aroused and determined public sentiment can solve the problem.
>
> Parents. Will you not teach your children the danger of walking or playing on railroad tracks or about cars?
>
> Teachers. Won't you talk to the children about the protection of their lives and limbs? Children like stories. Read them this one of Fred Warren or tell them a better one of your own.
>
> Ministers. Is this not a subject worthy of your consideration and comment?
>
> Employers. Will you not, in the interest of humane and economic policies, use all proper means in your power to prevent your employes from trespassing on railroad property? A large percentage of those injured and killed are laboring men going to and from their work.
>
> Legislators, Judges and Citizens. When will you bring about the enactment of laws, where necessary, and the enforcement of existing laws to stop trespassing on railroads?

THE HEAVY INCREASE IN RAILWAY TAXES

T. A. Polleys, tax commissioner of the Chicago, St. Paul, Minneapolis and Omaha Railway, has recently completed an investigation which tends to show that railway taxes per mile, in the five years from 1909 to 1914, almost tripled, in rate of expansion, the growth in the commercial value of the railways taxed. This general statement applies to fifty-three of the largest railway systems of the country, operating practically 190,000 miles of road.

The rapidity with which value is outstripping earning power, due to abnormally expanding costs and taxes, resulting in constantly smaller returns on new capital devoted to improvements and extensions, is another feature strikingly shown. To eliminate temporary or abnormal factors, averages for all the roads covering five years to 1909 are used for the most part in comparison with averages for the five years to 1914.

Between 1909 and 1914 the average commercial value per mile rose from $64,003 to $72,627, or 13 per cent. Between the two five-year periods gross revenues per mile rose in the same ratio of 13 per cent, or from $10,509 to $11,832. So excessive, however, was the rise in expenses that net per mile, from which returns on the 13 per cent greater value must be paid, increased only 7 per cent.

Taxes, on the other hand, showed no like disposition to lag. In contrast to the 13 per cent increase in per mile value they climbed in five years from $401 per mile to $548 per mile, a modest expansion of 37 per cent, practically three times as fast in proportion as the value of the property taxed!

After charging this rapidly expanding burden to net revenues, there is left in the five years to 1914 an average return of only 4.31 per cent on the value of the property, against 4.72 per cent five years before. In other words, while both value of the property and gross business done rose by 13 per cent, in the ratio of return on the investment there was an actual loss of almost 9 per cent.

Whereas in the first five years it took $67.26 of every $100 revenue to operate, it took $68.98 in the second five, while to operate and pay taxes the sum rises from $71.00 out of every $100 to $73.62. The ratio of taxes to gross earnings, despite the gain in the latter, jumped from 3.735 per cent in 1909 to 4.64 per cent in 1914 and taxes per $1,000 commercial value from $6.26 to $7.55, or 21 per cent.

Against the average increase of 13 per cent in commercial value of the railways included, the following figures display the proportionate rise in taxes on some of the properties from 1909 to 1914:

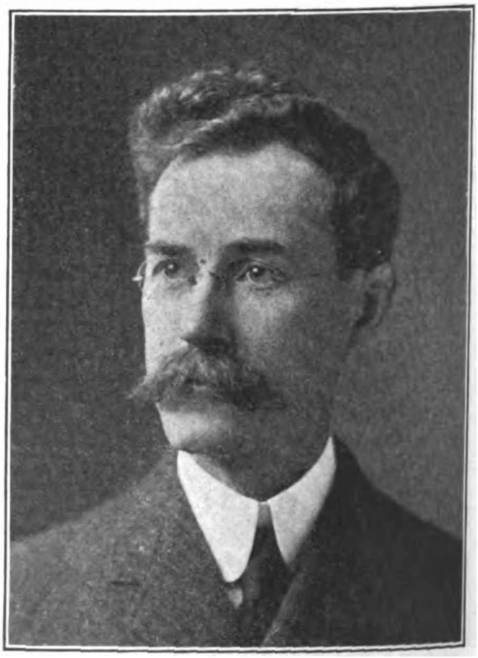
Company.	Per cent Increase in 5 yrs.
Atchison, Topeka and Santa Fe	65
Baltimore and Ohio	39
Chicago and Eastern Illinois	73
Chicago and North-Western	48
Chicago, Burlington and Quincy	56
Chicago, Milwaukee and St. Paul	31
Chicago, Rock Island and Pacific	43
Chicago, St. Paul, Minn'polis and Omaha	51
Cleveland, Cincinnati, Chicago and St. L.	40
Colorado Southern	73
Delaware and Hudson Company	44
Delaware, Lackawanna and Western	70
Erie Railroad	34
Great Northern	63
Illinois Central	40
Kansas City Southern	76
Lake Shore and Michigan Southern	34
Lehigh Valley	44
New York Central	34
Northern Pacific	77
Pennsylvania Railroad	72
Pennsylvania Company	46
Southern Pacific Company	70
Union Pacific	58

These increases in taxes per mile are in each case from 2 to 9 times the proportionate growth in value, while two of the largest increases per mile are despite actual contraction in value per mile which has taken place as a result of the larger divisor of additional mileage.

SETTLEMENT OF PHILADELPHIA SUBURBAN FARE CONTROVERSY

Somewhat over a month ago the railroads entering Philadelphia, in conformity with the general recommendations made by the Interstate Commerce Commission that the passenger service of the railroads should bear a fairer proportion of the cost of operation, made certain increases in their suburban passenger fares which led to considerable opposition and criticism which finally developed in an appeal to the Pennsylvania Public Service Commission. The greatest opposition centered around the withdrawal of the 100-trip ticket by the Pennsylvania Railroad and the 50-trip ticket by the Reading. While the low rate at which these tickets were issued was considered a good reason for their withdrawal, the fact that many commuters abused their privilege and often failed to present their tickets, was another and very strong reason why this form of ticket was decided upon as being impracticable. The present method of punching these tickets makes the success of the conductors' efforts largely dependent upon the honesty of the individual and, strange as it may appear, people who are absolutely honest in every other particular, still consider it a privilege to beat the railways whenever they can. The character of the 100-trip ticket, which was valid for a year from time of purchase, offers a temptation which is entirely lacking in the employment of a ticket, whose time limit is more restricted like that of the monthly ticket.

The Pennsylvania Public Service Commission after considering the pleas of both the commuters and the railroads, decided upon the restoration of the 100-trip ticket at an advanced rate, however, the maximum cost being placed at 1½ cents per mile, while the cost of the 10-trip ticket was placed at two cents per mile. As the Reading had no 100-trip ticket on sale and was about to withdraw the 50-trip ticket, the Commission made its 100-trip ticket ruling applicable to this road as well as to the Pennsylvania. The time limit in both cases was reduced to six months. The Commission also permitted an advance in both the 60-trip monthly ticket and the 46-trip monthly school ticket, but ruled that these tickets in the future, would be valid one month from the date issued instead of only for the calendar month in which issued. In other words, a 60-trip ticket purchased, for example, on January 10th will be valid for one month from that date instead of being good only until the end of January.



Emory R. Johnson of the Pennsylvania Public Service Commission.

The railroads had also withdrawn their round-trip tickets which were a slight reduction over twice the one way fare. This action the Commission refused to interfere with, so that in the future, no roundtrip tickets will be sold between Philadelphia and its outlying suburban districts at reduced rates.

As a whole, the decision was a victory for the railways as it clearly recognized their right to make appreciable increases in their passenger fares. While all the changes considered necessary were not permitted, the railways have gained probably as much as they could have expected under the circumstances, and at the same time popular resentment which was strong under the original changes, has been greatly decreased.

Professor Emory R. Johnson, a member of the Commission, issued the following statement regarding the decision:

> The Commission has given careful consideration to the schedule of fares that may with justice to the public and with fairness to the carriers, be charged different classes of suburban passengers. It seemed to the Commission that the following scale of fares for suburban passengers having different demands for transportation would be reasonable:
>
> First—Sixty, forty-six and 180-trip individual commutation tickets which are sold at about 1 cent per mile on the average.
>
> Second—One hundred-trip individual tickets good for six months from the date of issue, sold at a rate not exceeding 1½ cents per mile.
>
> Third—Ten-trip tickets, good for bearer and those accompanying the bearer, sold at a rate not exceeding 2 cents per mile.
>
> In addition to these three classes of tickets the 1,000-mile tickets now sold at 2¼ cents per mile, will be available for those who travel irregularly as well as the regular one-way and round trip tickets sold at the standard fare of 2½ cents per mile.
>
> The decision of the Commission authorizes a part of the increase in suburban passenger fares sought to be made by the carriers. This is deemed justifiable in view of the showing made by the carriers as regards their present passenger revenue and expenses. The restoration of the 100-trip ticket will be an advantage to a large number of suburban residents who make frequent but not daily trips into the city, and the reduction of the charge for the 10-trip tickets from 2¼ cents to 2 cents per mile will mean a substantial saving to many persons.
>
> The order of the Commission making the school tickets and 60-trip tickets good for one month from the date of issue instead of for a calendar month, and the 180-trip tickets good for three months from date of issue instead of for three calendar months, will also reduce the passenger expenses of many users of monthly and quarterly tickets.

On the same day the decision was made public, the Pennsylvania Railroad issued the following official statement:

> The Pennsylvania Railroad will comply with the recommendations of the Pennsylvania Public Service Commission concerning passenger rates. Immediately upon the decision being rendered, arrangements were made to file the proper tariffs embodying the new rates, both State and interstate, and these new tariffs will, with the permission of the Interstate Commerce Commission, become effective on December 15, the same date on which the rates as originally filed were to have gone into effect.
>
> The increases as originally provided were in compliance with the general recommendations of the Interstate Commerce Commission that in view of the unremunerative character of the passenger traffic, the railroads take measures to increase their passenger revenues.
>
> The Pennsylvania State Commission now also finds that additional passenger earnings are justified. It is to be hoped that actual experience with the new rates now recommended by the Commission will produce such a satisfactory effect upon revenues that further general readjustments of passenger rates will be unnecessary in the near future.

THE LABOR SITUATION

Little has developed recently in the railway labor situation, outside of the demands of the Western locomotive engineers and firemen, to embarrass the operation of the railways. The fact of the great shrinkage in railway earnings, coupled with the necessity of laying off thousands of railway employes, has kept the railway labor unions in a frame of mind not conducive of fresh demands upon the carriers.

The danger, however, like the sword of Damocles, still hangs over the head of railway operating officials, and it doubtless only needs the return of more prosperous conditions, to witness railway labor again engaged in a mighty effort to squeeze the last dollar out of what heretofore has appeared to be an inexhaustible till.

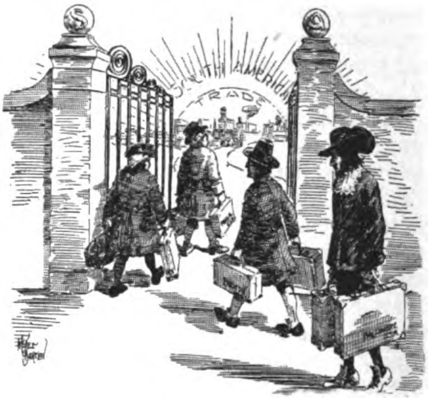
Under different conditions there would have been a great reduction in the wages paid to railway labor during the past six months. Employes in other industries, and in fact railway officials and the clerical service, have suffered salary reductions. The wages of railway labor, however, which have been fixed through boards of arbitration or mediation, have held firm, and other branches of the service have had to foot the bill. These conditions have been partially met by a greater reduction in the working force than would otherwise have been necessary, and, in this way, labor has really been the loser, as it always will be when temporarily successful in forcing unsound economic conditions upon the general railway situation.

Government ownership has so often been held up as a panacea for all railway ills, that it is interesting to note how conditions of a similar character are met in countries where the railways are owned by the Government.

Recent reports from Switzerland, where the State railroads of that country are run on a miniature scale by conditions similar to those affecting American roads, state that the wages of employes have recently been reduced and an increase in rates is under consideration in a supreme effort to make both ends meet. To quote from a recent report issued at Chicago by the Bureau of Railway News and Statistics:

> While American roads are facing demands for immense increases in wages, however, the Swiss Federal railways have made a reduction, through abrogation by the Government of advances in wages and salaries recently awarded and a reduction in appropriations to pensions and benevolent funds, a saving in all of over $1,150,000.
>
> Yet with the war's effects added to the long continued rise in operating costs, it has been found in Switzerland as in the United States that contraction in expenditures will not suffice to maintain equilibrium between income and outgo within a visible period. The only recourse, according to the Swiss advices is "a thoroughgoing advance in rates."
>
> Freight rates are already so high, averaging in 1911 for all Swiss roads 2.92 cents per ton mile, almost four times the average in the United States, that it is considered impossible to advance them further. It is feared also that an advance would result in diverting from Switzerland what international through traffic now passes over its lines, with further loss to them and profit to neighboring foreign roads.
>
> The advance, therefore, must fall on passenger traffic, especially on the cheap return tickets, which it is suggested to increase from 15 to 20 per cent, which, with a corresponding advance in "circle tickets" and a smaller increase in baggage rates, would afford about $1,000,000.

Gates Ajar!

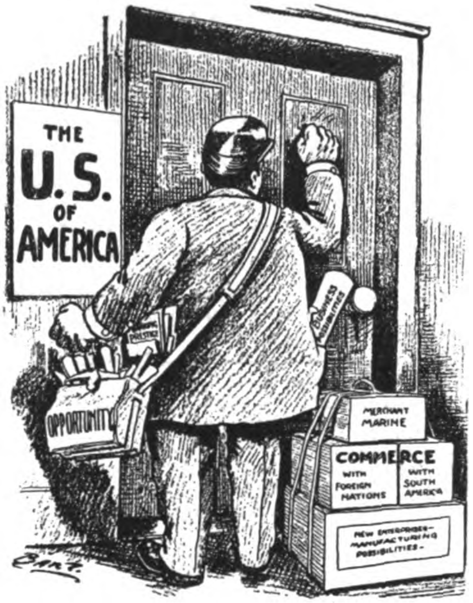


—From the *Baltimore Sun.*

EFFECT OF THE EUROPEAN WAR UPON IMMIGRATION

Considerable has been written in the RAILWAY WORLD within recent months concerning the probable after-effect of the European war upon immigration and it has been freely predicted that the greatest flow of immigration, in the history of the United States, would commence with the close of this great conflict. These predictions appear to be fully justified by a recent interview which our Canadian representative had with Colonel A. D. Davidson, land commissioner of the Canadian Northern Railway, who is not only one of the most noted pioneers of Canadian development but has recently returned from Great Britain where he has been making observations regarding the probable migratory movements which will result from this war. Colonel Davidson said:

> After the Franco-Prussian War in 1871 there began a heavy procession of families and ex-soldiers from Germany to the United States. Militarism, then as now, sent scores of thousands in search of a land where worthier ideals held sway and the Middle States benefited very materially. Canada at that time was not, of course, in the eyes of the world as she is now. The French held to their own land with that steadfast affection which has refused to recognize the lure of new homes in a new country. But the French peasant to-day must face a different problem. The devastation in the rich valleys where the troops are now fighting is near to absolute. Farm buildings, villages, are razed to the earth. Churches and schoolhouses are smoking ruins. Forests have been cleared away, roads blown up, almost every material thing tbout which associations cling exist no longer within the region of hostilities. When the war closes, thousands of French farmers must face the question of starting life anew. Undoubtedly the French Government will encourage them to return to their old homes, but against that will be the prospect of free farms in Canada, a land under the Allies' flag.
>
> I am convinced, too, that we shall add to the population of Canada many thousands of Belgians. Commercially, that heroic country is a wreck. Rehabilitation under the best imaginable circumstances must be slow and difficult. Is it, therefore, too much to say that large numbers of Belgian farmers finding their life's work blotted out by German invasion will look favorably upon the broad and peaceful fields of the Canadian West? I feel certain that this result will come about in the days following the war, and we could not open our doors to worthier fellow-citizens. As for the English and Scotch who have been coming to us in such splendid numbers I anticipate a resumption of British emigration to an ex-



KNOCKING AT OUR DOOR.
—*Minneapolis Journal.*

tent quite equal to what we have already seen. The reasons, I think, are obvious. Thousands of young farmers at the end of the war, possibly one or two years from the time they volunteered, will return to England to find their jobs filled by others or their connection with old employers disturbed in accidental ways. The point is, they will have been uprooted, as it were, sufficiently to enable them to make a clean start in a new country without a great sentimental sacrifice. Suppose that the Canadian people step into the limelight at such a time with an invitation to settle on free homesteads! Is it too optimistic to think that the invitation will be greedily accepted and that numbers of British army men will throw in their lot with us. Every likelihood points to that coming about.

The opportunity which Colonel Davidson points out for Canada is as fully available for the United States. A return to prosperity, within a reasonably short time, would mean an instant and increasing demand for labor on the farms, in the mines and in the factories throughout practically all sections of the country, but particularly in the great Western regions where the wonderful resources of this great Nation have only been slightly developed. No doubt the railroad officials of the United States are as fully cognizant of this opportunity as are their Canadian neighbors, and when the proper time comes we may look for an increase in immigration figures which will set a new record for such movements.

Contemporary Opinion

The Business Man and the Rate Advance.

DISCUSSING the railroads' application for increased rates now before the Interstate Commerce Commission, the Dry Goods Economist, in part, says:

No unbiased merchant could have read the testimony presented at the belated hearing accorded the railroads by the Interstate Commerce Commission on Monday of this week without being impressed with the seriousness of the situation which the roads are now facing. We are well aware that hostility to the roads has not been permitted to die down. We know, too, that many merchants do not realize the extent to which they themselves would benefit through the impetus to business in general, which would inevitably result from putting the railroads on a sound financial basis. It is high time, however, to take a broader view of the situation.

Lack of proper appreciation of the sweeping change in conditions is now dangerous. It may have fatal consequences. If the policy of starving the railroads, in order to punish them for past misdeeds, or to pound all for the shortcomings of the few, ever was in order, unquestionably it is out of order now. As the "Economist" has suggested, to continue such tactics now is playing with fire. Granting that an advance in freight rates would temporarily place a burden on the merchant who must pay the slightly higher bills, such a burden would not seriously injure him. The railroads, however, if not promptly permitted to make due provision for their needs will be driven into bankruptcy. What that would mean to the individual merchant, as well as to the nation as a whole, cannot readily be overstated.

Nor is this merely a national question. Our credit abroad, not only for integrity, but even for common sense, is involved. Thousands of American holders of our railroad securities, too, would benefit by the roads being put in a position to pay dividends, and the stockholders' prosperity would inure to the benefit of producers and distributors of merchandise. It is elementary that if the railroads cannot pay dividends they cannot get money except by hand-to-mouth borrowing at high interest, which is unsound finance.

As is well known, many branches of industry are now suffering from the railroads' inability to make expenditures. Such outlays are essential to the railroads' upkeep, to safety in travel and to the prompt transportation of freight. They cannot be made, however, so long as month by month the net income of the roads continues to fall.

The "Economist" again urges, therefore, that the Interstate Commerce Commission, if it wishes to retain the confidence of the nation, must consider this matter both with wisdom and with promptitude. It must lift its eyes from the mass of statistics and other details with which it has been busied and consider not merely the railroads themselves, but the country at large, and, more especially, the numerous industries which, in greater or less degree, are dependent on the railroads' welfare.

So far the Commission has not exhibited this broad spirit. It is a matter of deep regret, for example, that the Commission should have required the railroads to confine their arguments to changes occurring during the last three or four months, instead of permitting them to present every fair reason for granting the advances prayed for. It is a pity, too, that having laid down all sorts of regulations for the roads to follow, the Commission now requires the aid of special, highly paid counsel to examine and cross-examine the spokesmen for the roads. As the New York "World" points out, this attitude of the Commission is precisely what might be expected if the railroads were parties defendant in a criminal action, and as if the Commission stood not merely as a judge, but as prosecutor and jury.

The Commission was authorized and organized by the Federal Government to protect the public. It now looks as if the public might well exclaim: Save us from our friends! It is safe to predict that if the Commission cannot see the signs of the times our citizens, who though their legislators created it, will demand either the abolition of this governmental bureau or a radical curtailment of its powers.

The Railways' Side of the Rate Situation.

(From the New York "Times.")

IT will be seen that the case of the railways is really the case of the country. The prosperity of the railways is inseparable from the prosperity of those who either use or own them. An axiom, probably there never can be good times when the railways are harassed by poverty and apprehensions of bankruptcy.

Under the practice of the Commission, the regulation of the reasonableness of rates was transmuted into the regulation of the reasonableness of profits, and certain rates were lowered because they produced too much income, although the rates themselves were not unreasonable. The next step was to regulate rates not with regard to their reasonableness, but with regard to efficiency of management. Rates were not allowed to be raised because better management might produce larger profits. At neither step was there any consideration of the reasonableness of rates with reference to other prices, both of things that the railways consumed and of all other prices. The ideal rate sought was something reasonable in and of itself, which might be enacted as unchangeably as a law against murder or theft. The conditions produced show that the search for the ideal rate is as futile as the search for "The good, the true and the beautiful." No doubt it exists, but it is not to be found by mortals. In other words, regulation as it has been practiced is a failure. Regulation is not a failure, only the sort of regulation we have had.

All prices are relative to conditions, and change their quality with conditions. Conduct relates to the past, something actually done. Rates are laws and relate to the future. Rates should be higher or lower looking ahead, not looking backward. Dividends look backward, and are related to past rates. New rates are concerned with the future, and it is here that regulation has most conspicuously failed.

The Interstate Commerce Commission's Report.

(From the New York "Times.")

IT is impossible to read the reports and proceedings of the Interstate Commerce Commission without admiring its industry in attempting the impossible, and without thinking that it is as much in need of protection against overwork as the railways are of regulation. It is not every case which can secure a hearing in the Supreme Court, but anybody can demand the attention of the Commission through the mails. Not even a lawyer or a real grievance is necessary. The Commission has a special "informal" docket of 7,600 cases in less than a year, and it is constantly growing. On the formal docket there were 1,081 cases. There is a special docket regarding railway refunds, a fourth section docket, and, most important of all, an "investigation and suspension" docket, the graveyard of attempts to advance rates. Finally there are the hearings and investigations which the Commission undertakes of its own motion.

Inasmuch as no seven men could manage well the affairs of a single great railway, it may be said without dispute or disparagement that no seven men can settle all the country's railway disputes, including a degree of regulation which approximates management. The Commission is buried under its business, and details receive a degree of attention incompatible with due deliberation upon cases involving issues of principle and importance. It is difficult to say that any of this business should go undone, even if it is trivial. But it is easy to see that if the country's important business is to be done by the Commission, the unimportant business should be strained out by some system of appeal, as in the courts. It would be as much in the interest of the country as in kindness to the Commission.

Most of the Commission's report is historical, a smaller portion than usual being given to requests for power to deal with future cases. Still there are some little things the Commission would like to control, such as the capitalization of railways, the compulsory use of steel cars, the unlimited power to inspect anything in writing upon the files of the railways. The list might be prolonged, but the samples suffice to show how far the regulation of rates has expanded beyond the original conception. It is coming to be perceived that the regulation of rates is the regulation of a price, something which has eluded the accomplishment of lawgivers in all times. Always it is discovered that something has been left out of the law, and some further enactment is necessary. At present it is dawning upon the country that there may be too much regulation as well as too little, and that some ideals may be too costly for realization. The present condition of the railways must be charged to the Commission, since they have a great deal more law than they began by asking for, and have never given the country the least intimation that if they had their way conditions like the present would result. The Commission is so thoroughly in control that responsibility is shifted from the railways to the Commission, and this occurs at a time when their promises of good things to come are at a discount.

That is true even in the case where the Commission has come nearest to fulfilling expectation. In its own words, the reform of the express companies is almost complete. Grievances have been remedied, and conditions are "generally satisfactory to patrons of the express companies." The patrons alone are satisfied. The express companies' condition is worse than that of the railways to the extent that their reform is more complete. Only one-tenth of their operating income is left to them, the decrease for eleven companies being from $4,413,000 last year to $404,000 this year. Several leading companies operated at a loss, and are worse off than if they had not worked. If the patrons are not grateful to the Commission, it is hard to perceive what more the Commission could do for them. Nobody is more surprised by this than the Iowa Commissioner of Railways, Mr. Clifford Thorne. His comment upon these figures was that they were "amazing. I don't know whether it spells the end of the express business in this country." Apparently neither Mr. Thorne nor the Commission has any fear that their methods are approaching anything like a similar outcome in a broader field.

A Note of Optimism.

(From "Greater New York," the Official Organ of the Merchants' Association of New York.)

EVERY day brings additional evidences of the return of prosperity. A new and hopeful spirit is everywhere apparent. The courage and resourcefulness of American business men are rapidly clearing the pathways of progress and confidence is crowding despondency to the wall.

The novel conditions which were created by domestic legislation and by the paralysis of foreign trade resulting from the war have not only been largely overcome, but are being turned to good account. The agencies of exchange, temporarily closed, are being put into operation again. The machinery of production, partially halted, is resuming its normal activity. News of factories starting up is taking the place of news of factories closing down.

Influences are still to be found here and there to deny the return of good times, but such denials are designed mainly to furnish basis for argument. They are constantly being weakened by the contradiction of facts.

The Decalogue of Safety.

(From the "Frisco Man.")

THE ten commandments of Safety First promulgated at the annual meeting of the National Council for Industrial Safety, at Chicago, October 13th, are:

"Thou shalt have no other thoughts than thy work.

"Thou shalt make no unnecessary risks, nor try to show off, nor play practical jokes, for by thy carelessness thou mayest do injury which will have effect into the third and fourth generation.

"Thou shalt not swear nor lose thy temper when things do not come just right.

"Remember that thou art not the only one on the job and that other lives are just as important as thine own.

"Honor thy job and thyself, that thy days may be long and in employment.

"Thou shalt not clean machinery while it is in motion.

"Thou shalt not watch thy neighbor's work, but attend to thine own.

"Thou shalt not let the sleeves of thy shirt hang loose, nor the flaps of thine coat be unbuttoned as they may get caught in the machinery.

"Thou shalt not throw matches or greasy waste on the floor, nor scatter oil around bearings, as a dirty worker is a clumsy worker, and a clumsy worker is a menace to his fellow workers.

"Thou shalt not interfere with the switches, nor the cables, nor the engines, nor anything else that thou art told is dangerous."

Loyalty.

(From the Rio Grande "Service Gazette.")

LOYALTY to our company does not mean the mere compliance with the rules and regulations, any more than loyalty to our country means the mere non-violation of the laws of the nation, state, city or county in which we reside.

Loyalty does mean to be faithful to ourselves, to those on whom we are dependent as well as to those who are dependent upon us, by having a definite purpose or aim, in the execution of which we are inspired with interest and enthusiasm, not only with a view of doing something, but in doing that something well. In other words, make everything we do count for the welfare and success of our company and ourselves.

The loyal man has power, poise and steadfastness in that which is undertaken; he loves the task placed before him and instead of work it becomes for him an art.

Only the man who watches the clock with no definite object in view beyond the monthly pay check, is a worker—he may not be disloyal at first, but he has neither the faith nor the fixity of purpose which would raise his task from the plane of meniality, and consequently he becomes a slave instead of an artist; finally he comes to the point where he thinks everyone "has it in for him," and then he does become disloyal, not only to himself, but to others.

Our company is dependent on the loyalty of its employes, and naturally every employe is dependent on the success enjoyed by the company. Anything that affects the prosperity of our company affects every individual connected with it, and to-day as never before are the management and staff of employes so dependent on each other.

In this hour of need, let each and every one of us show our loyalty by increased interest and activity in our daily tasks, by working as if the road was our very own, by heeding the appeals of the management for further efforts towards effecting economical operation in the conduct of our stations and offices, and any other way which will show the management that their interests are our own, that their confidence in us is not misplaced.

Loyalty counts.

Personal

Ivy L. Lee.

IVY L. LEE, executive assistant to President Rea, of the Pennsylvania Railroad, has tendered his resignation, effective January 1st, to become a member of the personal staff of John D. Rockefeller, New York City, and will take up the duties on this staff of Jerome D. Greene, who will in future devote his entire time to the Rockefeller Foundation. Mr. Lee was born on July 16, 1877, at Cedartown, Ga. He was educated at Emory College, Oxford, Ga., and graduated from Princeton University with the class of 1898, and took post graduate work at Harvard and Columbia Universities. After several years' experience in editorial work on New York newspapers he entered the service of the Pennsylvania Railroad in 1906, and took charge of the publicity work of the company, and in 1908 established its publicity bureau. The following year he resigned from the Pennsylvania Railroad and became general European manager for Harris, Winthrop & Company, bankers. On December 1, 1912, he returned to the service of the Pennsylvania Railroad as executive assistant, from which he now resigns. From 1905 to 1907, Mr. Lee was the press representative for the anthracite coal operators and other corporations. He was a lecturer before the London School of Economics. He is a Fellow of the Royal Geographical Society and of the Royal Economic Society, also a member of the American Economic Association, and the Railroad Club of New York.

IVY L. LEE.

John E. Dalrymple.

JOHN E. DALRYMPLE, who on November 8, 1914, became vice-president of the Montreal and Southern Counties Railway, was born January 1, 1869, at Montreal, Canada. Entered railway service July 1, 1883, as junior clerk in treasurer's office, Grand Trunk Railway of Canada; since which he has been, consecutively, April, 1890, to February, 1896, secretary to freight traffic manager, Chicago & Grand Trunk Railway at Chicago; February, 1896, to May, 1899, secretary to general traffic manager, Grand Trunk Railway System, at Montreal; May to August, 1899, division freight agent, same road, at Hamilton, Ont.; August, 1899, to May, 1900, division freight agent, Grand Trunk Railway System, and manager, Grand Trunk Despatch Line, Detroit, Mich.; May, 1900, to March, 1901, general freight agent, Central Vermont Railway, St. Albans, Vt., March, 1901, to April 1902, assistant to second vice-president and general manager, Grand Trunk Railway System, Montreal, Que.; April, 1902, to August 13, 1905, general freight agent, Central Vermont Railway, 1908, general freight agent, Grand Trunk Railway System, Montreal, Que.; May 1, 1908, assistant freight traffic manager, Grand Trunk Pacific Railway, Winnipeg, Man.; October 1, 1911, vice-president in charge of traffic, Grand Trunk Railway System, Grand Trunk Pacific Railway, Grand Trunk Pacific Coast Steamship Company, Limited, Central Vermont Railway Co., and other Grand Trunk affiliated interests, including, effective November 8, 1914, Montreal & Southern Counties Railway.

J. E. DALRYMPLE.

George J. Bury.

GEORGE J. BURY has been selected to succeed David McNicoll as senior vice-president of the Canadian Pacific Railway System. Mr. Bury was born in Montreal in 1866 and was educated at the Montreal College. His whole career has been spent in the service of the C. P. R. He started work in 1883 as clerk in the purchasing department of the C. P. R. Since then he has made a steady progression upward, as clerk in the general manager's office

GEORGE J. BURY.

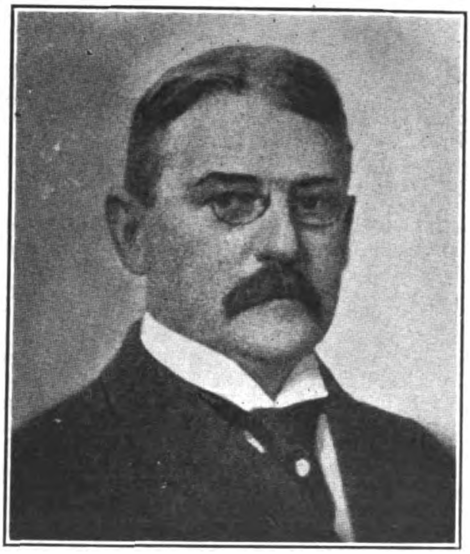
in 1884. He became secretary to the vice-president, now Sir Thomas Shaughnessy, and president, Sir William Van Horne, successively, in 1887, and acting superintendent of the sleeping car service in 1889. Then successively assistant superintendent of the Chalk River Division and superintendent of the North Bay Division. From there Mr. Bury went as divisional superintendent successively at Port William and Cranbrook, B. C. Then he became assistant general superintendent of the Lake Superior Division and in 1902 was appointed general superintendent of the same division.

In 1904, Mr. Bury was appointed General Superintendent of the Central division of the C. P. R. at Winnipeg, and continued in that office some time. Since then Mr. Bury has always been engaged in the western work of the Canadian Pacific, and when a few years ago the late Sir William Whyte retired from the western executive office, Mr. Bury was appointed to succeed him as vice-president. Since that time, Mr. Bury has been in charge of the western interests of the C. P. R., and has taken an active part in public affairs, especially with the upbuilding of the new western provinces and the carrying out of the propaganda for the introduction of mixed farming in the West.

During much of his career, Mr. Bury has worked in close touch with Sir Thomas Shaughnessy, Sir William Van Horne, and Mr. David McNicoll and is fully imbued with the progressive C. P. R. spirit. It is expected that Mr. Bury will return to Montreal within a short time to take up his residence here and assume his new duties at the headquarters of the C. P. R.

E. W. McKenna.

E. W. McKENNA, who has retired from the vice-presidency of the Chicago, Milwaukee and St. Paul, was born October 24, 1848, at Pittsburgh, Pa. He began railway work in May, 1862, with the Pennsylvania, and was messenger and operator until June, 1864, when he was in United States military telegraph service. From April, 1866, to December, 1869, he was with the Pittsburgh, Cincinnati & St. Louis as operator, freight clerk and general superintendent's clerk. He was then for one year train despatcher, and from February, 1871, to April, 1880, superintendent, of the Indianapolis & Vincennes, and the following five years was superintendent of the Jeffersonville, Madison & Indianapolis. During 1886 he was engaged in special work under the direction of the general manager of the Pennsylvania Lines West of Pittsburgh. Mr. McKenna became connected with the Chicago, Milwaukee & St. Paul in June, 1887, and was division superintendent until October, 1890, when he was appointed assistant general superintendent of that road. He left the St. Paul in August, 1894, to become general superintendent of the Eastern district of the Great Northern at St. Paul, Minn., resigning that position to engage in the business of renewing steel rails, being the inventor of a process for securing that result. He organized the McKenna Steel Working Company, of which he was president for a number of years. Mr. McKenna returned to the Chicago, Milwaukee & St. Paul in February, 1904, as assistant to the president, and in September of the following year he was made second vice-president. In September, 1909, he became vice-president of the same road in charge of operation and construction.

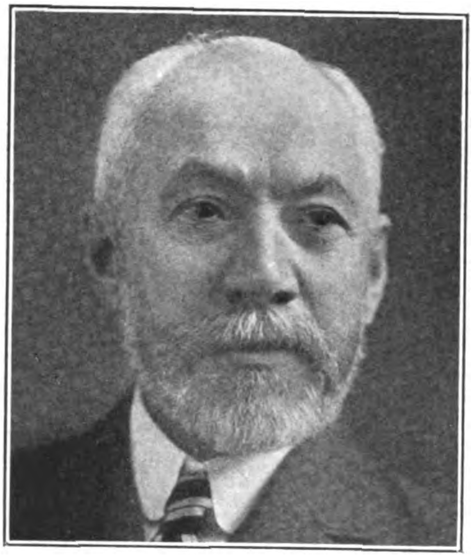


E. W. McKENNA.

David McNicoll.

DAVID McNICOLL, vice-president of the Canadian Pacific Railway, who has been associated with that system for more than forty years, is to retire on January 1, 1915, as the result of his desire to be relieved from the arduous duties of his position in order that he may have the rest and recuperation his present condition of health makes desirable.

Mr. McNicoll is only in his 62nd year, having been born at Arbroath, Scotland, in April, 1852. He started his life career as a railroad boy, fourteen years old, to the North British



David McNichol.

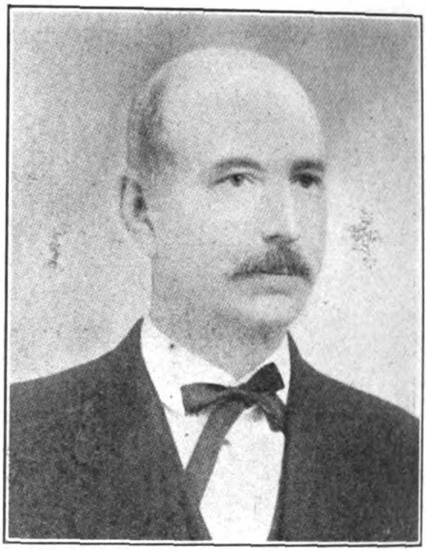
Railway of Scotland, after which he entered the service of the Midland Railway of England, in 1873, where he served for a year.

In 1874, Mr. McNicoll came to Canada and at once resumed his railway work. He was appointed billing clerk on the Northern Railway of Canada, being stationed at Medford and Collingwood, and in less than a year became chief clerk, and was removed to the general offices of the Toronto, Grey and Bruce Railway of Toronto. He remained in this position until 1881, when he became general freight and passenger agent of the same railway, and also general traffic agent of the Owen Sound Steamship Line, trading on the Upper Lakes.

In 1883, Mr. McNicoll was appointed general passenger agent of the Credit Valley, Toronto, Grey and Bruce and Ontario and Quebec Railways, and held this position until these lines were absorbed by the Canadian Pacific Railway. He was then appointed general passenger agent of the Eastern and Ontario Divisions of the C. P. R. and at once won recognition as one of the coming men on the Transcontinental Line. In 1899, Mr. McNicoll was appointed passenger traffic manager, which office he held until the following year, when he was appointed assistant general manager. Almost immediately afterwards, Mr. McNicoll was appointed second vice-president and general manager. After holding this office some years, Mr. McNicoll was appointed senior vice-president and elected a director of the Company.

While a few years ago the arrangement of the Company was changed so that all vice-presidents were placed on an equal basis, each in charge of a special department, Mr. McNicoll, in charge of the Traffic Department, was always recognized as the senior vice-president, and as such has exercised a powerful influence on the progress of the system.

When the C. P. R. a few years ago established its new harbor on the Georgian Bay as the eastern terminus of its late steamship system, it honored its senior vice-president by bestowing upon the new town and harbor the name of Port McNicoll.



E. Raymond.

E. RAYMOND, who has been appointed assistant to Vice-President Storey, of the Atchison, Topeka and Santa Fe Railway, began his railway work driving a team of mules on the Eldorado Branch of this road while it was in the course of construction in 1878. He was made a section foreman in 1880, and since then he has held consecutively the positions of roadmaster, general roadmaster, trainmaster, assistant superintendent, superintendent and general superintendent, appointed to the last named position in 1910.

Eugene J. Henry.

THE Lehigh Valley has created the position of western traffic manager to be located at Chicago and has appointed Eugene J. Henry to fill the place. Previous to his promo-

Eugene J. Henry.

tion, Mr. Henry was the general western freight agent of the Lehigh Valley Railroad.

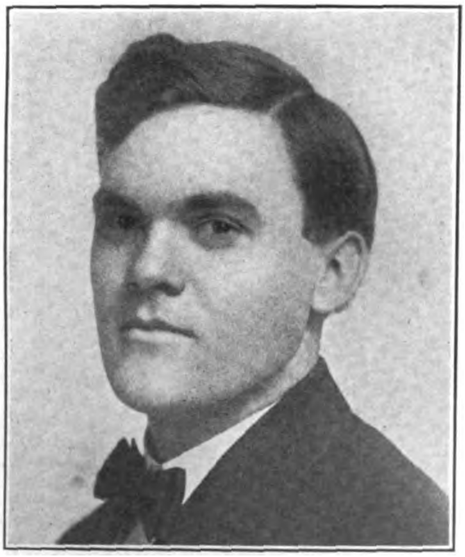
The departure from organization methods by which Mr. Henry will have charge of both freight and passenger business is an effort to bring about a closer co-operation between the two branches of the service. Recently the Lehigh Valley named Mr. W. T. Grier as general traffic manager, reporting only to the vice-president in charge of traffic, with jurisdiction over both freight and passenger business, and his appointment of Mr. Henry follows closely. All passenger and freight men of the Lehigh Valley in Chicago and to the west will report to Mr. Henry.

Mr. Henry has lived in Chicago many years. Born on a ship flying the American flag, of which his father was the skipper, at Penang, East India, his early life was spent in Maine. His cousin, Captain W. P. Henry, who still resides in Buffalo, N. Y., was one of the pioneers in modern day navigation on the Great Lakes. He was the designer of the steel package carrying vessel now in general use on the lakes.

Twenty-five years ago, Eugene Henry went to work for the Lehigh Valley Transportation Company, the concern his cousin had organized, as an assistant agent. The Lehigh Valley Transportation Company is the boat line of the railroad. Since then Mr. Henry has gone steadily upward, his new rank making him among the most important railroad officials in Chicago.

F. G. Hamblen.

F. G. HAMBLEN, who on December 1st, was appointed traffic manager of the Kansas and Memphis Railway, was born at Humansville, Mo., in 1886. He received a common and high school education and entered railway service in 1907 in the freight department of the St. Louis and San Francisco at Springfield, Mo. In 1909, he accepted a joint position with Wells Fargo and Company Express and the Kansas City and Memphis Railway at Rogers, Ark., and held various positions with the latter Company including local agent, trainmaster, commercial agent and general agent until December 1, 1914, when as above noted, he was appointed traffic manager of this road succeeding R. C. Hobbs, who was made general manager.



F. G. HAMBLEN.

Charles S. Lee.

CHARLES S. LEE, general passenger agent of the Lehigh Valley Railroad, who has just been named passenger traffic manager, has been with the system since 1893. His railroad career started in Washington in the seventies with the Big Four system, then known as the "Bee Line." In 1883 he was appointed chief clerk for the passenger department of the Denver & Rio Grande, working under Major S. K. Hooper. In 1887 he became general passenger agent of the Colorado Midland Railway later having charge of both passenger and freight departments. When this line passed into the hands of the Santa Fe, Mr. Lee came to the Lehigh Valley. His connection with the Lehigh Valley has been marked by many important improvements. He took part in the establishment of through service between New York and Philadelphia and Chicago, the inauguration of the Black Diamond Express, which has advertised the Lehigh Valley throughout the world and the first successful operation of a la carte dining service in the United States.

CHARLES S. LEE.

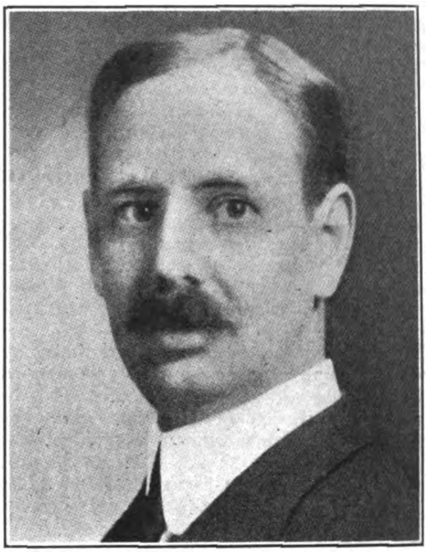
J. L. Graves.

J. L. GRAVES, who has recently been appointed general freight agent of the Southern Railway with headquarters at Knoxville, Tenn., is a native of Georgia. He entered the services of the Richmond and Danville and the Georgia Pacific Railways in 1892 and in 1895 became stenographer to the general superintendent of the Plant System, from there going to the Southeastern Car Service Association in a similar capacity. In 1897, he entered the services of the Southern Railway as stenographer to the second vice-president of the system at Washington, D. C., and since then has successively filled the following positions: Secretary to traffic manager, assistant chief clerk to traffic manager, chief clerk to vice-president in charge of traffic, assistant general freight agent and general freight agent at Memphis, Tenn., and coal freight agent at Atlanta, Ga. He was filling the last named place when he was promoted to the position of general freight agent at Knoxville as above noted.

George W. Hay.

GEORGE W. HAY, until lately general baggage and district passenger agent of the Lehigh Valley Railroad at South Bethlehem, Pa., has assumed his new duties as general passenger agent of the road with offices in New York. He succeeds Mr. Charles S. Lee, who has been promoted to the position of passenger traffic manager. Mr. Hay began his railroad career as a billing clerk in 1888 with the Grand Trunk Railroad in Detroit. With that road he later entered train service and advanced to the position of assistant general baggage agent. In 1906, after being with the Grand Trunk Railroad for over eighteen years, he accepted a position with the Lehigh Valley Railroad as general baggage and district passenger agent with headquarters in South Bethlehem. Since January 1, 1907, when Mr. Hay went with the Lehigh Valley Railroad, he has been marked by his aggressive attitude in regard to work. He is known for his good nature and liberality. When he stepped off the train at South Bethlehem seven years ago, he didn't know a soul in the city. When he left it to assume higher duties in New York, his promotion attracted widespread interest among the hundreds of friends and acquaintances he had formed. He has instituted a system of baggage handling that is second to none in the country, and has been copied by other railroads.

GEORGE W. HAY.



F. A. Lehman.

F. A. LEHMAN, who has been appointed general superintendent of the Western District of the Eastern lines of the Atchison, Topeka and Santa Fe, entered the services of this system as a telegraph operator on August 17, 1888, and has served consecutively in the following places: clerk in the general roadmaster's office, clerk in the trainmaster's office, clerk in the superintendent's office, dispatcher, clerk in the vice-president's office, chief clerk in the same office, superintendent of transportation, assistant to the vice-president.

Paul S. Millspaugh.

PAUL S. MILLSPAUGH, the second recently created assistant general passenger agent of the Lehigh Valley Railroad, will have his offices in Buffalo. The placing of the assis-

PAUL S. MILLSPAUGH.

tant general passenger agent in Buffalo is a recognition of the great importance of the business on the western end of the line. Mr. Millspaugh's work in Ithaca admirably fits him for the new position in Buffalo. In Ithaca he was known to every freshman and graduate of Cornell University for the last twenty years. He has traveled in every direction with football and baseball teams, crews and glee clubs. He is as familiar at Cornell student gatherings as the varsity colors. His success at Ithaca, however, was largely the result of hard work, combined with natural ability.

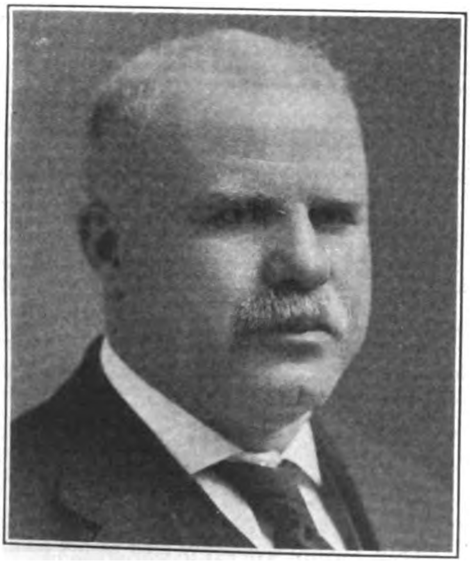
His first railroad experience was in Waverly, New York, as a joint representative of the Lehigh Valley and Erie Railroads, working as assistant auditor and ticket agent. In 1892 he went to Ithaca as ticket agent when the Lehigh Valley opened its line to Buffalo. Successively he was appointed traveling passenger agent, district passenger agent and general agent of the Passenger Department in Ithaca. At Buffalo Mr. Millspaugh's duties will include supervising the passenger business in the region about Buffalo, including Rochester, Niagara Falls, Hamilton and Toronto.

M. V. Richards.

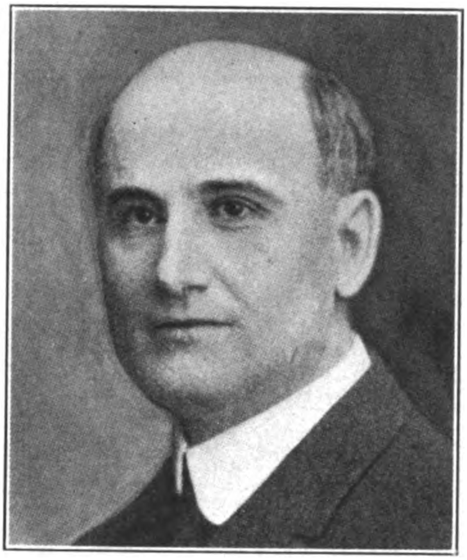
M. V. RICHARDS, industrial and agricultural commissioner of the Southern Railway, Georgia Southern & Florida Railway, Southern Railway in Mississippi, Virginia & Southwestern Railway, Hawkinsville & Florida Southern Railway, Augusta Southern Railway, Tallulah Falls Railway, Northern Alabama Railway, Blue Ridge Railway, Macon & Birmingham Railway, and Danville & Western Railway, has devoted thirty years to that important feature of railway development work.

His initial experience was with the Land Department of the Northern Pacific Railroad, during the early settlement of lands of that company in the Northwest extending from Lake Superior through to the Pacific Coast. In 1887 he was brought east by Mr. Samuel Spencer, then president of the Baltimore & Ohio, and organized the Land, Industrial & Immigration Department of that system. When the Southern Railway Company was organized in 1894, Mr. Richards was one of the early appointees in that year by Mr. Samuel Spencer, the president, and organized the Land and Industrial Department of that company. Recently the industrial, immigration and agricultural development work of the Southern Railway and many of its associated lines was incorporated into one department, which is known as the Industrial and Agricultural Department, in charge of Mr. Richards as commissioner.

The Southern Railway Company has been the leader in the development of the cities and towns and country along its lines, and its activities are recognized and appreciated.



M. V. RICHARDS.



H. C. Pribble.

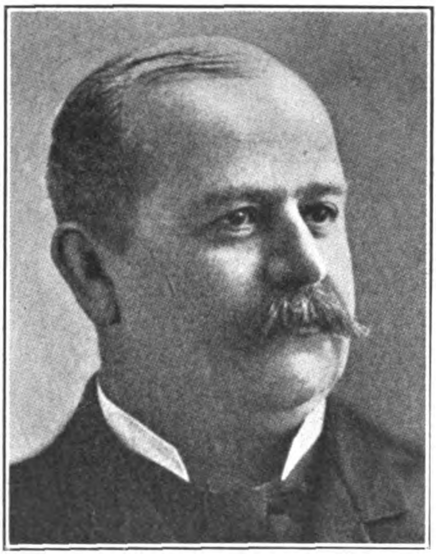
H. C. PRIBBLE has been appointed general claim agent of the Atchison, Topeka and Santa Fe Railway, succeeding the late J. D. M. Hamilton. Mr. Pribble may be regarded as a pioneer in the field of Santa Fe workers, having entered the employ of the company as a boy of seventeen on February 4, 1892, in the freight auditor's office. He served in various offices of the freight auditor's department, mastering every detail of his work and fitting himself all the time for promotions, which came regularly.

In October, 1905, Mr. Pribble was made chief clerk in the agents' account section. In May, 1907, he was appointed chief clerk in the freight claim office. In February, 1908, he was promoted to be assistant chief clerk in the freight auditing department, and in January, 1909, he was assigned to the chief clerkship of the entire office.

The day before Christmas, 1909, Mr. Pribble was chosen to be freight claim auditor, a new position, in which capacity he has served the Santa Fe up to the present time.

Obituary

A. C. Bird, formerly vice-president in charge of traffic of the Gould Lines, died on November 28th, at Pasadena, Cal. Mr. Bird was born at Pittsfield, Ill., on March 4, 1843, and began railway work in 1865 with the St. Louis, Alton and Terre Haute. He held various minor positions until 1872, when he went to the St. Louis, Kansas City and Northern, as chief clerk in the general freight office. In July, 1874, he was appointed general freight agent of that road, and in November, 1879, he accepted a similar position with the Wabash, St. Louis & Pacific, being promoted to superintendent of freight traffic in January, 1880. He resigned the latter position on January 1, 1883, to become general freight agent of the Chicago, Milwaukee and St. Paul, of which road he was freight traffic manager from February, 1889, to December, 1895; general traffic manager of the following four years, and third vice-president from December, 1899, to March, 1903. Mr. Bird then went to the Gould lines as vice-president in charge of traffic, with headquarters at Chicago, resigning in November 1907, since which time he had not been engaged in active railway work.



A. C. Bird.

James Bissett, formerly master mechanic of the St. Louis & San Francisco Railroad at Springfield, Mo., died on November 11th, in Springfield, aged 74 years. He began railway work with the North Madison Railway, at North Madison, Ind., and subsequently served on different railroads. In October, 1899, he entered the service of the Kansas City Fort Scott & Memphis at its shops at Springfield, and later served as master mechanic of its successor, the St. Louis & San Francisco, until his retirement, under the pension rules of the company, about two years ago.

Edwin C. Brown, formerly general superintendent and from September, 1891 to 1910, assistant to the president of the Michigan Central, died in Detroit, Mich., on December 5th, aged 83 years.

George F. Clough, commercial agent of the Lake Shore & Michigan Southern at Cleveland, Ohio, died on November 8th, aged 38 years.

L. Freeman Day, formerly vice-president and general manager of the Minneapolis & St. Louis Railroad and of the Iowa Central Railway, died November 13th at the Great Northern Hotel in New York. Mr. Day was born in 1858 in De Witt County, Ill., and was educated in the public schools. He started in the railroad business in 1885 as a clerk in the employ of the Texas & St. Louis Railroad. Two years later he became chief clerk in the general freight office of the St. Louis Southwestern Railway and rose rapidly until, in 1892, he was freight traffic manager. After serving in various positions on other roads, in 1897 he was appointed general manager of the Minneapolis & St. Louis. Two years later he became vice-president of the road and in 1900 was appointed to a similar position on the Iowa Central. From 1893 until 1897, he was chairman of the Southwestern Traffic Association. Mr. Day retired from active business about five years ago.

Harry Dean, division freight agent of the Pere Marquette Railroad at Detroit, Mich., died on November 22nd, in Detroit, Mich.

Charles Dyer, second vice-president of the National Dump Car Company, Chicago, and formerly general superintendent of the Colorado & Southern Railway, died at his home in Denver, Colo., November 8th, aged 69 years. Previous to his service with the Colorado & Southern, 1870 to 1900, he was successively clerk and operator, agent, chief despatcher, trainmaster, and division superintendent with the Atchison, Topeka & Santa Fe Railway.

Henry Fonde, general agent of the Southern Railway at Knoxville, Tenn., died at his home in that city on November 28th.

James Geddes, assistant to general manager of the Louisville & Nashville Railroad, died at Nashville, Tenn., November 15th. He was born January 16, 1828, at Portsoy, Banffshire, Scotland. Until 1850 he was connected with the Great Western Railway, England, and on coming to this country, became associated with the Louisville & Nashville, assisting in the original survey of that road. He celebrated his half century in the road's service September 2, 1901, at which time his associates presented him with a silver service and he was appointed assistant general manager.

J. T. Hazzard, agent of the Blue Ridge Dispatch, at Chicago, died in that city November 9th.

Harry A. Jones, retired assistant treasurer of the Southern Pacific Company, died at his home in San Francisco, November 12th, aged 63 years. Mr. Jones was born in Madison, Ind., and entered the railway service as a freight clerk with the Missouri Pacific Railway in 1870. In 1906 he was appointed freight traffic manager of the Southern Pacific. On July 15, 1912, he became assistant treasurer.

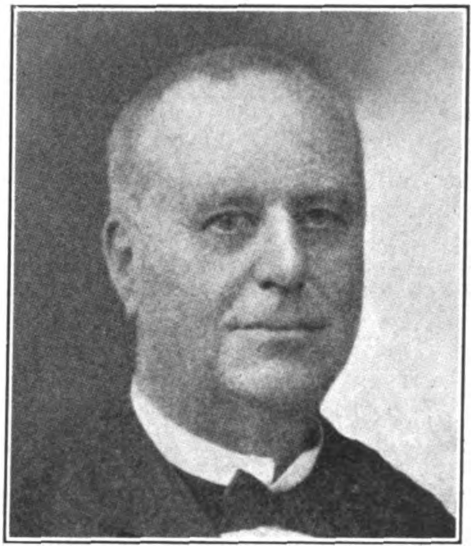
C. C. Mallard, superintendent of the Arizona Eastern, with headquarters at Globe, Ariz., died at New Orleans, La., on November 24th, aged 54 years. He had been in railway service since 1879, when he commenced as rodman on Morgan's Louisiana and Texas Railroad. Subsequently, he was assistant engineer on the Sabine and East Texas and the Houston & Texas Central; engineer for the contractors on the Chicago, Texas & Mexican; roadmaster and assistant engineer of Morgan's Louisiana & Texas, and assistant superintendent bridges and buildings of the Atlantic System of the Southern Pacific, until July, 1898. He was then until August, 1905, successively division engineer of the latter company and assistant superintendent of the Louisiana Lines. From September, 1905, to January, 1906, he was assistant engineer and roadmaster of the Gila Valley, Globe and Northern, and since the latter date Mr. Mallard has been superintendent of that road and its successor, the Arizona Eastern.

Henry D. Mirick, who was general freight agent of the Missouri, Kansas and Texas in 1871, died in Washington, D. C., November 26th, aged 79 years.

John C. Muir, general superintendent of the Chicago, Terre Haute & Southeastern Railway, died at Terre Haute, Ind., on November 4th, aged 50 years. Mr. Muir began railway work in June, 1879, as messenger for the Atchison, Topeka & Santa Fe Railway, with which road he remained until August, 1895, being employed successively as telegraph operator, station agent, traveling auditor, train despatcher, and chief train despatcher. He then went to the Chicago & Eastern Illinois Railroad as chief train despatcher, and subsequently was trainmaster and superintendent until June, 1911, when he was appointed general superintendent at Danville, Ill. In November of the following year, he became superintendent of the Chicago Division at Danville. He went to the Chicago, Terre Haute & Southeastern as general superintendent in March, 1913.

Hartwell Osborn, commercial agent of the Queen & Crescent route at Chicago, died at his residence, Evanston, Ill., November 13th, aged 74 years.

Lucius Tuttle, former chairman of the Board of Directors of the Boston and Maine Railroad. died November 30th at his home in Brookline, Mass. Death was due to angina pectoris. Mr. Tuttle was born at Hartford, Conn., March 11, 1846, and entered railway service in 1865, with the Hartford, Providence & Fishkill Road. He was general ticket agent of that road when it was absorbed by the New York & New England and he became assistant general passenger agent, and successively general manager and ticket agent and assistant to general manager of the Eastern Railway. In 1885, he entered the employ of the Boston & Lowell Road as its general passenger agent, but in two years he resigned to become the general passenger traffic manager of the Canadian Pacific Railway. Later he became manager and then first vice-president of the New York, New Haven & Hartford Railroad. He was elected to the presidency of the Boston & Maine Road in 1895. In October, 1910, he was made chairman of the Board of Directors.



LUCIUS TUTTLE.

Owen J. Travis, formerly superintendent of bridges of the Colorado and Southern and the Ft. Worth and Denver City, died at Everett, Wash., on November 14th, aged 66 years. Mr. Travis entered the service of the Keystone Bridge Company in 1868 as bridge builder at Kansas City, Mo., and from 1877 to 1881, was superintendent of traffic of the St. Louis Bridge Company. He was then for three years superintendent of bridges and buildings of the Middle Division of the Wabash, St. Louis and Pacific, and from 1884 to 1889, was general foreman of the Chicago and St. Louis Division of that road. The succeeding four years he was with the Iowa Central as superintendent of bridges and buildings, going to the Elgin, Joliet & Eastern in 1893, in a similar capacity. He was superintendent of bridges of the Illinois Central from 1897 to 1903, when he became superintendent of bridges and buildings of the Colorado and Southern and the Ft. Worth and Denver City at Fort Worth, Texas. Mr. Travis held the latter position until his retirement from active railway service in 1910.

J. H. Waters, president and general manager of the Florence & Cripple Creek Railroad, died November 27th, as a result of injuries received in a collision between a railroad motor car and a light engine at Cripple Creek, Colo., on the preceding Wednesday. Mr. Waters received a fractured skull and internal injuries. He never regained consciousness. Mr. Waters was 51 years old.

John Watson, formerly superintendent of dining cars of the Grand Trunk Railway, died at his home in Battle Creek, Mich., November 27th, aged 79 years.

Financial

Financial Results for the First Quarter of the Fiscal Year.

WITH over 6,000 more miles of line in operation, railways of the United States closed the first quarter of the current fiscal year with a loss of almost $18,000,000 in net compared with two years ago. Though the quarter's gross earnings were $7,740,000 smaller than then, the cost of hauling the contracted business rose $10,200,000, resulting in a net loss of $17,940,000.

The figures, based by the Bureau of Railway News and Statistics on the official figures of the Interstate Commerce Commission, apply to over 255,000 miles of operated railway, the total operated mileage of the country, and take into account some 27,000 miles of so-called small roads not appearing in the Commission's totals.

Resulting from drastic curtailment in expenses put into effect since the great slump in traffic began just a year ago, there has been effected finally, for September, a small increase in net compared with last year. This improvement, it should be noted, however, is due almost wholly to the extremely bad showing made a year ago, when constantly dropping business was being hauled at constantly expanding cost and net revenues were suffering losses compared with the previous year of from $5,000,000 to $20,000,000 every month. Only by comparison with these showings a year ago is the improvement in net in the current September figures seen in true proportion.

—From the *Wall Street Journal.*

For the three months of the first quarter, on the other hand, even in comparison with last year's showing, there is a further loss of $429,000 in net revenues, while after an expansion of $1,396,000 in total taxes, net income drops $1,825,000 below the poor showing of a year ago.

For September and the first quarter the Bureau's totals for the entire railway mileage follow, compared with last year:

September—	1914	Loss
Mileage	255,365	*3,179
Gross	$276,778,000	$14,221,000
Expenses	183,330,000	14,850,000
Net	93,448,000	*629,000
Taxes	11,922,000	*455,000
Net Income	81,526,000	*174,000
First Quarter—		
Gross	813,126,000	38,503,000
Expenses	551,922,000	38,074,000
Net	261,204,000	429,000
Taxes	35,506,000	1,390,000
Net Income	225,698,000	1,825,000

---

* Increase.

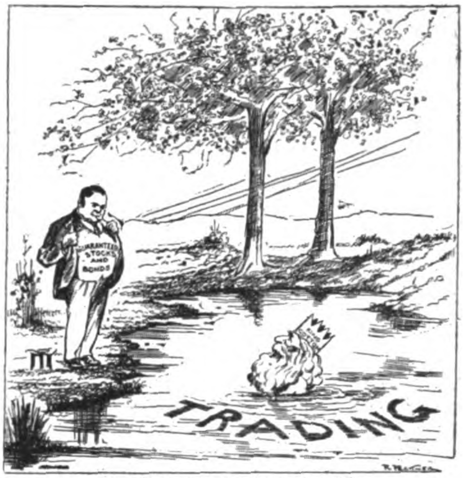
For nine months to September, comprising three-quarters of the current calendar year, there has been a drop in railway traffic on the Country's entire mileage, of $121,193,000, compared with the nine months in 1913. Despite their most strenuous efforts to keep expenses under control on this violent ebb tide of business, the railways succeed in cutting only $69,612,000 from the figure of the year before, and with more than 3,000 of additional railway in operation, compared with 1913, the railways in these nine months earned $51,581,000 less net revenue.

Revenues and Expenses of Steam Roads for September.

THE Bureau of Railway Economics at Washington has issued a summary of revenues and expenses of the steam roads in the United States for September which shows, in brief, that operating income for that month, reduced to a per mile of line basis and compared with that for September, 1913, shows a decrease of $3.00 or 0.9 per cent, while operating income per mile for September, 1913, showed a decrease of 8.1 per cent, as compared with that for September, 1912. Total operating revenues per mile for September decreased 6.0 per cent, as compared with September, 1913, operating expenses per mile decreased 8.5 per cent, and net operating revenue decreased 0.5 per cent.

Railways operating 228,041 miles of line are covered by this summary, or about ninety per cent of all steam railway mileage in the United States. Their operating revenues for the month of September, 1914, amounted to $269,581,592. This amount includes revenues from freight and passenger traffic, from carrying mail and express, and from miscellaneous sources connected with rail and auxiliary operations. Compared with September, 1913, these operating revenues show a decrease of $13,792,318. Total operating revenues per mile averaged $1,182 in September, 1914, and $1,257 in September, 1913, a decrease of $75, or 6.0 per cent.

Operating expenses, which include the cost of maintaining track and equipment, operating trains, securing traffic, and of administration, amounted to $178,086,808. This was $14,380,302 less than for September, 1913. These operating expenses per mile of line averaged $781 in September, 1914 and $854 in September, 1913, a decrease of $73 per mile, or 8.5 per cent.



COME ON IN, THE WATER'S FINE.

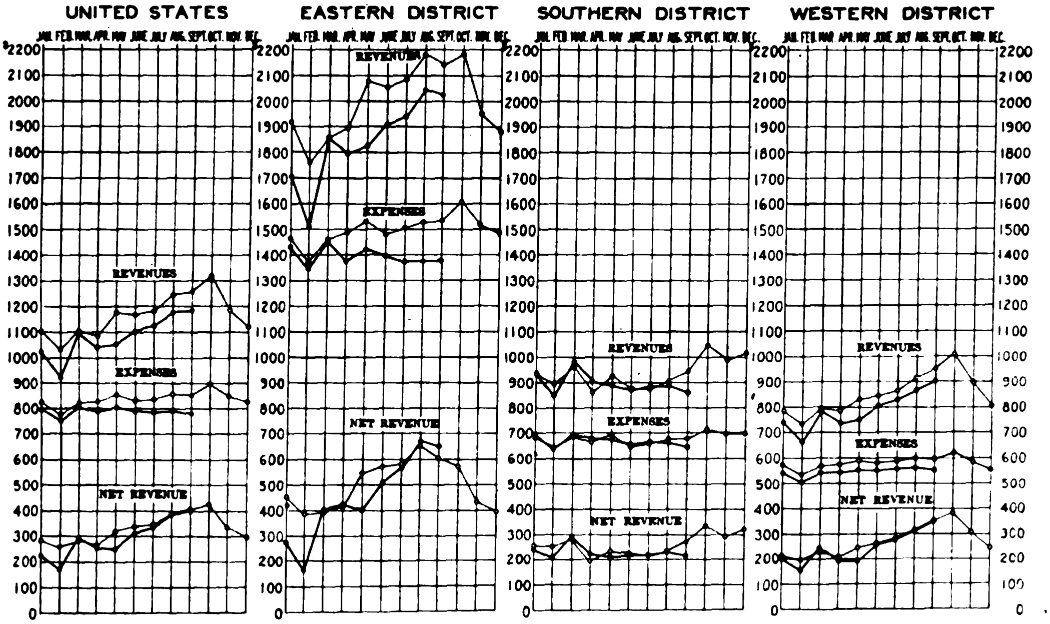
—From the *Financial America.*

Net operating revenue, that is, total operating revenues of rail and auxiliary operations less operating expenses, amounted to $91,494,784, which was $587,984 more than for September, 1913, but this increase is due to increase in operated mileage, as is shown by the fact that net operating revenue per mile decreased. Net operating revenue per mile of line averaged $401 in September, 1914, and $403 in September, 1913, a decrease of $2 per mile, or 0.5 per cent.

MONTHLY REVENUES AND EXPENSES PER MILE OF LINE

ROADS HAVING ANNUAL OPERATING REVENUES ABOVE $1 000 000

CALENDAR YEAR:
1913 •
1914 •



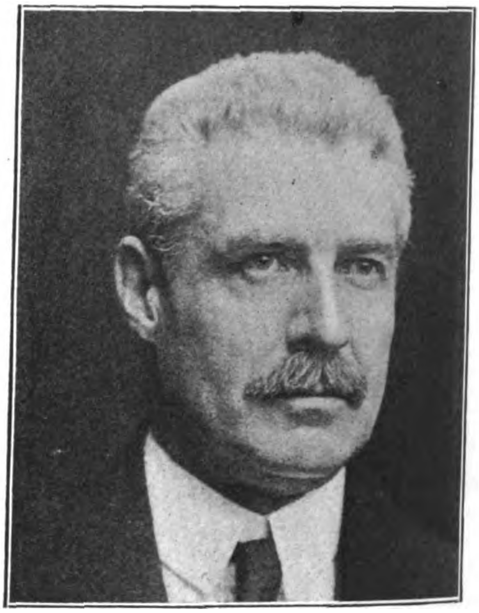
The points on the vertical lines are of significance only in showing the condition for the particular month. The lines connecting the points assist in tracing the change from month to month but do not indicate the trend during the month, nor are they cumulative for the period.

Taxes for the month of September amounted to $11,454,768, or $50 per mile, an increase of 2.0 per cent over September, 1913.

Operating income, which is net revenue from rail and auxiliary operations, less taxes, averaged $351 per mile of line, and in September, 1913, $354, thus decreasing $3, or 0.9 per cent. Operating income for each mile of line for each day in September averaged $11.69 and in September, 1913, $11.80. Operating income is that proportion of their operating receipts which remains available to the railways for rentals, interest on bonds, appropriations for betterments, improvements, new construction and for dividends.

The Necessity for a Constructive Policy in the Practice of Public Regulation*

By Samuel Rea, President, Pennsylvania Railroad Company.



Samuel Rea,
President of the Pennsylvania Railroad.

Although holding no commission to speak for the railroads as a whole, the seriousness of their present position may warrant an expression of my views on the general railroad situation. I therefore appreciate the fitting opportunity you have given me to present certain suggestions for the consideration of this thoroughly representative gathering.

It is no difficult task to sum up the present railroad situation. We can all see that something is wrong, but no useful purpose will be served unless we can suggest some constructive methods of improving railroad conditions.

Examine, for instance, the Eastern railroads, which reach the centres of the largest population and heaviest traffic of the country, and you will find greatly diminished gross revenues and a still greater proportionate reduction in net revenues; their purchasing powers are stringently curtailed, and their credit has been greatly weakened. This condition arises from causes largely beyond their own control, so that the return earned during the past year upon the money invested in the road and equipment of the railroads amounted to less than four per cent. This serious condition is not new, but it is now acute. We have been living on hope at least since 1910, when the downward trend was clearly indicated; how much longer we can exist on that precarious asset, I will not venture to say, except to suggest that it takes more than hope, advice, or enthusiasm, or all combined, to pay wages and taxes, provide satisfactory service, pay dividends, and retain a proper credit basis to obtain capital for improvements and extensions.

Increased traffic will not cure the railroad malady, for remember that up to the present all their economies and efficiency, obtained by increased train loads, etc., have been offset by increased costs, wages and taxes. These companies therefore need not merely the very moderate increase in rates for which they petitioned the Interstate Commerce Commission, but also the revenue that can be secured by working out in practice the various other means suggested by the Commission for increasing revenue.

A full consideration of the railroad position and the effects of public regulation must not however stop there. Irrespective of any decision in the rate case now pending, whether it be finally favorable (as we trust it will be) or unfavorable, it is evident that the time is ripe for suggestions concerning constructive railroad legislation and policy.

I need not remind you that after agriculture—and what would agriculture be without railroads?—the railroads are not merely the most important industry in the country, but they are also in their essence public institutions performing functions which are by their very nature of a public character. They are owned in part by an army of individuals, actually holding their stocks and bonds, and in part by institutions such as savings banks, insurance companies, universities, hospitals and other philanthropic enterprises, in the welfare of which many more millions of individuals are vitally concerned. These are largely dependent upon income derived from the money they have invested in the service of the public, and rightfully they hold railroad managers responsible for this income. It should be the business of government regulation, not merely to see that the public is properly served by these railroad managers, but also to see that the owners of the properties are fairly compensated, and that their revenues are sufficient to properly discharge their duties to the public. Otherwise the managements of these companies will be prevented from efficiently discharging their obligations to the public and their owners. The railroads must give the public good service and their operations must be continuous in good times and in bad. Moreover, the railroads of the country pay over $140,000,000 in taxes every year, a sum equal to five per cent on nearly three billions of dollars, requiring over 16 per cent of their net operating revenues. They pay good wages to their own employes and furnish profitable employment for the industries which furnish railroad materials and supplies.

---

*Remarks made at Chamber of Commerce meeting, New York, December 3rd, 1914.

But apparently the interests of everyone have been safeguarded under public regulation except the interests of those who furnish the money for the public service; and we must protect these investors upon whom we must rely for future capital. Failure in the last decade to protect the railroads and railroad investors has at last produced a lack of confidence in public regulation, and we now know that through the weakness of the railroads, the whole country is suffering. Upon this great industry, through the operation of too many hastily enacted Federal and State laws, and by failure to provide and adjust the machinery necessary to enforce these laws by reasonable and practical methods, a mistaken policy of repression has been imposed, which has not permitted railroad charges to increase with the enforced increase in the cost of their operations. This has caused loss to existing railroads, and has precluded the building of new lines, and the making of needed improvements and betterments on the present roads. The inherent weakness of the present situation is that we as a people seem to have assumed that the present railroads and their equipment facilities are complete, and are sufficient for present and future needs, and that the chief function of public regulation is to curtail their revenues, increase their expenses and lessen the margin of return. In this growing country, the present railroads are far from adequate, and therefore the policy of repression is bound to bring, if it has not brought already, a day of reckoning. Let us not forget that if we expect people to continue supplying their savings for our railroads, present and future, their earnings must continue to be what these investors regard as reasonable and sufficient, and they are not likely to be governed by the opinions of legislators, or commissions in this respect. The present policy of repression must be modified and lack of confidence must be removed, or these millions of investors will seek other avenues to utilize their capital.

There are some particular features of the railroad situation, incidental to public regulation, to which I would direct attention.

The railroads are existing under conditions that breed business depressions, because of arbitrary, heavy and frequently unjustifiable burdens imposed upon them, by legislatures, State and National, and there are still many wasteful legislative experiments forthcoming unless the authors discover that the public will not willingly pay their cost. Public opinion is now convinced, I feel, that the railroads are entitled to more equitable treatment under public regulation, and that opinion and your very kind invitation have opened the way for me to offer some suggestions.

The present situation is not the result of premeditated action or of a clearly defined punitive public policy; it is the result of our failure to fairly adjust our national conception of the rights and duties of these common carriers, and to adapt our new laws for public regulation to rapidly changing commercial and financial conditions. It is not, therefore, a case for mere sterile criticism, but for mutual study and co-operation to the end that the evils now existing may be clearly recognized and corrected. The public, the railroads and the commissions, State and Federal, should unite in an effort to ascertain and finally establish the principles upon which wise regulation should hereafter proceed, so as to retain for the people at large the advantage of our American system of private ownership and operation under public regulation, and avoid being forced into another system far less desirable in a country such as this.

Can it reasonably be contended that any large and important business enterprise, whether individual or corporate, could be successfully conducted if, notwithstanding radically changed conditions and substantially increased costs of production, it could only increase prices subject to the power of an administrative body which on its own initiative and without a hearing might suspend the increased prices for an extended period? Under the existing Federal law, increases in railroad rates, no matter how reasonable or justifiable, may be suspended without any hearing, for at least four months after they would have become operative. In practice, this means five months after the rate schedules are filed with the Commission, and the suspension may be extended by the Commission for a further period of six months. It is, therefore, possible even if the new rates are justifiable, for the railroads to lose nearly a year of benefit from them while the Commission is determining their reasonableness. Is the public welfare promoted thereby? From practical experience and in a spirit of fairness and justice, I should say it is not, and the period of such suspension, and the determination of the question at issue, ought to be restricted to sixty days after the date of filing new rate schedules with the Commission.

Another trouble in the present situation is that the Interstate Commerce Commission has been over-burdened with work and with responsibilities, many of which must be deputed to a large corps of subordinates, so that in many instances, direct consideration by the entire Commission is impossible. The work of the Interstate Commerce Commission, as originally designed in 1887, was to prevent unjust discrimination in rates or service, to see that rates were reasonable, to secure publicity of railroad rates and practices, prescribe uniform railroad reports, and primarily act as a referee between the public and the railroads. The Commission was given limited, but well defined, powers within reasonable scope. Now, however, as the result of new laws, the scope of its control of railroad operations and development has been largely extended. It could materially assist railroad development, but so far it has proven impossible for seven men in one centre to act not merely as regulators but as administrators of the railroads, leaving the financial results and responsibility of that administration to be borne by the companies and their owners.

There is also a certain amount of disagreement between the Federal and State laws and orders of commissions, and of failure to recognize the inroads on railroad revenues of new laws, orders and of governmental awards.

Let me use just one example of the commercial chaos resulting from such conflict. The recent difference in the views of the Interstate Commerce Commission, on the one hand, and the Public Service Commission of New York, on the other, in connection with the allowances to industrial railroads, has, during the last eight months, resulted in freight rates, via the lines of the New York Central (whose route is intrastate) from one of the large industries at Buffalo to New York City, and to other places on its line, lower than via any of the other trunk lines, as their routes between Buffalo and New York are interstate, and there is nothing that the other railroads could do to meet this situation, injurious as it was, not only to themselves, but also to industries local to their lines. The same situation arising from the same cause, existed in the State of Pennsylvania, as between the Pennsylvania Railroad Company and other trunk lines. These differences must be reconciled for the welfare of the public and the railroads.

In the practice of public regulation, from the constructive side, I would at this time suggest:

First.—That the Interstate Commerce Commission should be materially increased, and so organized as to be able to deal promptly with the very important railroad questions affecting all parts of this large country, and thus conserve the time and energy of railroad officers, the public and the Commission. The additional members of the Commission should be selected from men having experience in railroad management, operation, traffic and finance, and if men of broad business experience were also added, it would be very helpful.

Second.—That the position should be placed beyond political influence, by a long tenure of office, and with compensation sufficient to attract and retain men of the widest experience and greatest ability. We recognize the necessity for men of this character and technical experience in dealing with banking and other broad business enterprises, and we must recognize that equally wide experience is just as essential to deal intelligently and wisely with the railroad problems.

Third.—That the regulatory power of the Interstate Commerce Commission should be clearly extended to the supervision and control of all rates and practices which directly, or remotely, affect interstate transportation or commerce.

Fourth.—That the Interstate Commerce Commission should be given the power to interfere, by appropriate action, whenever necessary to maintain a rate structure approved by, or satisfactory to, it, even though, to accomplish this, it should be necessary for the Commission to prevent reductions of rates which would have a contrary effect, or to compel advances of rates found by the Commission to be unreasonably low. An unreasonably low rate may be beneficial to some one or more shippers, but the rates of some other shippers are sure to be disadvantageously affected thereby.

Fifth.—That for the existing repressive policy of public legislation, a constructive policy should be substituted, and existing legislation should be so modified as to permit the railroad companies to do their full share in the development of the country's resources. It will naturally follow that the Commission should be enabled, and indeed required, in the determination of questions involving railroad rates and practices, to deal with the questions before it, not merely from the standpoint of the shipper and the carrier, but from the larger standpoint of the entire country, and on such economic and business lines that due and controlling weight may be given to these larger interests essential to the public welfare. Such a change in public policy and legislation is requisite to encourage the investment of private capital for railroad extensions and additional facilities.

For instance, I seriously question the practical utility of railroad valuation, for I believe that very few railroads are over-capitalized, and I know the public is not required to pay higher rates on weak roads than on the more conservatively capitalized railroad lines. Therefore, while the railroads are cordially and fully co-operating in the work of Federal valuation, yet under present conditions and when economies are being enforced everywhere, I look to the Commission, under such an equitable public policy as I have in mind, not to commit the country and the railroads to so vast an expenditure until one system, or the lines in one section of the country, shall first be valued and the results demonstrated to the country.

Sixth.—That, as another necessary result of a constructive and equitable policy towards railroads, and with a commission amply strengthened to deal with railroad questions, Congress would no doubt refer to the Commission for investigation and report, such legislation as affected wages, employes' working hours and conditions, increased taxes, boiler inspections, extra and unnecessary men on trains, non-compensatory mail and parcel post service, railroad valuation, improved stations, grade crossing elimination, and other matters which seriously affect railway revenues and expenses. Due weight to these heavy expenditures would thus be given in approving rate schedules, and a tangible basis would be thereby provided on which to continue the regulation of these matters (if essential to the public welfare) without injustice to the railroads. The inability of the railroads to protect themselves in respect to increased wages fixed by governmental action could not be more forcibly presented than in the November, 1913, report of the Board of Arbitrators under the Newlands Act, relating to conductors' and trainmen's wages on which your president served as chairman.

Seventh.—That the extraordinary power to suspend rates without a hearing should be limited to a period not exceeding sixty days after being filed with the Commission, or some such reasonable period. If after such hearing as could readily be had within this period, coupled with the information and data already possessed by the Commission, from the current and special reports made by the railroads, under its uniform accounting regulations, the Commission could not be satisfied that the increase proposed ought not to be made, the rate should rightfully become effective, and the present confusion and delay would end. The railroads as an act of self-preservation will always endeavor to make their service and facilities satisfactory, and rates reasonable, because only in this way can they make friends, encourage business and earn profits.

In conclusion I say that considerable emphasis has been laid upon the fact that the railroad companies, and their owners, are deprived of an appeal to the courts for the protection of what they conceive to be their just rights as against the orders of the Commission. I am willing, however, to continue relying upon public regulation and public opinion to protect the railroads, although I cannot overlook the fact that the Eastern railroads are earning a return of less than four per cent on their property investment. If this is not approaching confiscation, how much less must we earn before reaching that point? Surely the country does not want impoverished railroads unduly restricted in the conduct of their business. What it does want is strong, aggressive lines, built and improved with private capital, efficiently managed and operated, subject to equitable public regulation.

What I have suggested may not meet all the difficulties in the public regulation of railroads. Other helpful suggestions will doubtless be forthcoming from railroad and business men and commercial bodies, etc., and, I trust, from some statesmen. There can be no difference of opinion that public regulation must be equitable so far as the railroads are concerned, and must be adjusted to promptly respond to business conditions. Such a change will encourage initiative and enterprise in railroad management and will assure investors, here and abroad, that their money has the full protection of our laws and that they will be equitably dealt with.

I believe in regulation by commission, and I urge, therefore, that we do not encourage destruction of such regulation, but rather its conservation, by adapting it, as we have banking regulation and other laws, to suit the needs of the country as they change from time to time. We must look beyond the present obstacles and view the whole subject from the staesman's standpoint. Under an enlightened policy of public regulation, but not repression, the railroads will be placed and kept in a strong position to meet increased traffic demands, as well as to live healthfully in times of depression. If we now by equitable dealing ensure their strength, one of the greatest obstacles to the recovery of financial confidence and business enterprise can be removed.

Our Inconsistent National Policy in Respect to Transportation

By William A. Robertson.

William A. Robertson.

Under a system of popular government, where the suffrage is very widely extended, as in the United States, it must sometimes happen that public enthusiasm will expend itself in advocacy of policies which are calculated to injure the true interests of the cause which the voters have most earnestly at heart. More than this, the government may occasionally find itself committed to the support of two different lines of action which, when analyzed, are widely at variance. The truth of these assertions has more than once been emphasized in our financial history. It can be easily discerned at the present time in the nation's attitude toward the problems of transportation.

Between ten and fifteen years ago, the American people undertook a course of aggressive supervision over the transportation of merchandise by land. There had previously been a great deal of regulation of one sort or another—some of it very drastic—but it had emanated chiefly from the States. Necessarily, therefore, it had dealt only with commerce moving within the confines of a single political division of our Union. Prior to 1902, regulation of interstate commerce by the Federal Government can hardly be said to have been very aggressive. In that year, the suit against the Northern Securities Company was begun. Since that date, the Government at Washington has actively exerted itself to control the movement of commerce between the States. This activity has showed itself sometimes in the shape of suits against railroad corporations—as in the case of the Northern Securities Company, or the St. Louis Terminal Railroad—and sometimes in the form of statutes amplifying and extending the powers of the Interstate Commerce Commission.

During nearly the same period, there has been another important popular movement along an entirely different line. The American people have been considering, and have partly undertaken upon a very comprehensive scale, the development of a far-reaching system of transportation by water, including the attempt to build an extensive mercantile marine. It was in 1901 that the first National Rivers and Harbors Congress met at Baltimore; and in 1903 that the electors of the State of New York voted to improve the Erie Canal at a cost of $101,000,000. Since then, the movement for waterway improvement has been persistent and successful.

Both of these great popular agitations have been based wholly or in large part upon the belief that the railroads were charging excessive rates for the carriage of freight, and that, unless restrained in some manner, and compelled to move goods more cheaply, the American people would suffer extortion, the material development of the country would be checked, and the United States would fall behind in the race for industrial supremacy.

It must be evident, however, that in the long run, transportation by water must go hand in hand with transportation by land. Both are but parts of one desired end, namely, the opening and developing of the entire country, so that its resources may be utilized and laid upon the markets of the world. The two things must be made to contribute to the common end, and it will not do to encourage one system of transportation, and make its burdens light, while embarrassing and encumbering the other. That will simply make a distorted and one-sided result.

The purpose of the present article is to contrast the policy of the United States toward transportation by water as against its policy in dealing with transportation by land. We shall then be in a position to consider whether the two policies are harmonious, and conducive to the general prosperity and welfare of the voters and taxpayers at large, or whether they are really discordant, and calculated to arrest development and retard real progress. Let us consider the case of water transportation first.

Commerce by water is now enjoying the benefits of a policy of very liberal assistance from both the Nation and the States. So far as the National Government is concerned, this assistance to American shipping is given in four principal ways, whether that shipping be upon the high seas or upon inland waters.

First.—Congress has for quite a number of years, been pouring forth public treasure upon the improvement of waterways to an extent that few of us fully realize. Our periodical river and harbor bills are intended to bring about the enlargement and improvement of existing waterways, and also to create new ones. The work is undertaken both upon rivers and harbors already navigable, and also upon bodies of water that are naturally too shallow for vessels of any considerable size and draught. In either case, the Government seeks to deepen the channel to some prescribed limit. In still other instances, the Government makes an entirely new waterway, and enters actively into the work of canal building, as for example, in the case of the Norfolk and Beaufort Inlet Waterway.

The sums which Congress has thus appropriated from time to time are so princely in amount that the mere name "River and Harbor Bill" has acquired an odious notoriety. Of this the average citizen is vividly aware. But comparatively few persons realize how great have been the actual sums which have been thus spent in the past few years. The 59th, 60th, 61st and 62d Congresses appropriated, altogether, for river and harbor improvement, over $189,000,000.

No one seriously entertains the idea that these projects will ever return into the National treasury anything like the money which they have drawn out. Most of the public benefit that is contemplated is altogether indirect and general, consisting in the real or supposed advantage to commerce and the resulting increase in the general property of the people at large. There is no thought that any system of tolls or tonnage taxes or harbor dues will ever result in a revenue sufficient to return the principal back into the Federal treasury. We are not now speaking in either condemnation or approval of the work of waterway improvement. Space entirely forbids an attempt to enter upon such a discussion. We are simply calling attention to the facts as they exist in cold and forcible reality.

Second.—Congress also seeks to aid shipping by providing that all materials for the building and equipment of ships may be imported in bond, free of duty. In other words, the Government tries to give relief from the burden of taxation.

Third.—The general Government maintains a splendid system of lighthouses and beacons along our entire coast line and up the courses of many rivers.

Fourth.—Since 1891, the Government has stood ready to pay quite liberally to American vessels for the carriage of the mails upon the ocean.

Over and above this contribution of the general Government to the cause of commerce by water, many of our States are also undertaking to build canals or improve those already existing. Witness, for instance, the improvement of the Erie Canal by New York State at the cost of over $100,000,000. It is not expected that any tolls will be charged. It will be a free gift to American inland shipping.

As soon as we turn to the subject of transportation by land, we are struck with the contrast in the attitude of both the public and the Government. There is a complete "right-about-face." There are no liberal gifts of money and no freedom from taxation. In place of these we find their very opposition, burdensome taxes, embarrassing regulation, repressive laws.

The time has been when all this was far different. During the 40 years that followed the invention of the steam locomotive, the attitude of the American people toward railroads was liberal and generous. Between 1840 and 1870, it was not uncommon for the States or the general Government to make handsome donations of land for the encouragement of new railroads.

In recent years, it has become fashionable to denounce this former policy of land grants, and to argue that the railroads received far more than they ever gave. We need not now enter into the merits of this criticism, although the case for the roads is very strong. It is sufficient to say that, if it was a mistake to donate any portion of the public domain in a new and unsettled country, for the purpose of building railroads which were to become great public highways, then assuredly it is doubly questionable whether the Government is justified at this present time in spending such large sums of the taxpayers' money in so many sorts of waterway improvements. No benefit, save an indirect one, can possibly result—and as to even that there is much room for doubt in many cases. The argument of indirect benefit is precisely the same sort of reasoning as was formerly used in justification of the land grants. What was claimed was that so great an indirect benefit would accrue to the country at large from the building of the railroads that were to receive the land grants, that the public would, in the end, receive back much more than the value of the land they were giving away. In the light of history, there is much to make it probable that this argument was well founded, and that the results have abundantly justified the land grants.

But all that is past and over. No one is giving away public land to any railroad. It is now more than forty years since any considerable gift of the kind was made. Far from taking any such course, the Government has reecntly tried to recover back from one of the continental roads many thousands of acres which it originally granted.

In place of the old policy of encouragement, there have come burdens and handicaps. These take the following forms:

First.—*Rate Reductions.*—These have come from both Federal and State commissions. Their number and extent is very large, and it is impossible to tell in figures just how great a depletion of railroad revenue has been thus effected. A single unfavorable decision may mean the loss of many hundreds of thousands of dollars. But the roads may not raise their rates without a permission which is almost impossible to secure.

Second.—*Increase in Taxation.*—This has been simply astounding, and out of all proportion to any possible increase in the real value and earning power of the properties. Railway taxes have advanced from $57,849,000 in 1903 to $129,052,922 in 1913. No other class of property has suffered such an immense increase in the weight of its burden of contribution to the expenses of government.

Third.—*Expenses Arising from Government Supervision.*—These are very numerous. But it will be enough to name only three.

(a) Printing of all sorts made necessary in order to comply with the requirements of State and Federal commissions. The printing and filing of tariffs, filling out of forms and answering of questions put by Government agencies has now become very expensive. For instance, for the year 1913, the St. Paul Road spent over $267,000 for stationery and printing; the Reading's bill was over $189,000.

We do not mean that the whole of these large sums was made necessary by Governmental action. Of course, that was not the case; but nevertheless a very large outlay is now absolutely necessary in order to meet the many exacting demands of the Government and its agencies.

(b) *Abolition of Grade Crossings.*—This sort of work is rapidly proceeding in all parts of the country, and is urged on by a multitude of State laws or by order of the State commissions. Desirable as it is, it can not be accomplished all at once. When it is realized that the average cost of abolishing a single crossing is $50,000, and that not infrequently it is much more, it is easy to form some idea of the burden the roads are now shouldering to meet the public demand on this point. Sometimes the expense is shared by the State, county or town, and sometimes not. In any event, it is very heavy.

(c) *Full Crew Laws.*—On this point, some of the States have directly interfered to render the business of moving freight more expensive than it was previously. This interference is the more exasperating because it has been, in many cases, wholly unwise and uncalled for; and is directly opposed to every principle of sound economy and scientific management.

Moreover, the railroads not only do not receive liberal compensation for their work in carrying parcel post matter, but have had the utmost difficulty in persuading the Government to give them anything like adequate remuneration. Unlike the steamships, they have had no encouragement whatever along this line.

The result of this repressive policy is now being made plain to every one. A point has at length been reached where the railroads cannot go forward relying on their reserve strength. They must have more freedom and new resources, if they are to do their part in the Nation's struggle for success.

Now if a stranger to our cou[illegible]
and reflect upon these widely [illegible]
conduct and policy toward t[illegible]
transportation industry, he [illegible]
amazement. He would be [illegible]
why it could be wise econo[illegible]
the American people to [illegible]

assist one kind of transportation, while taking such pains to thwart and embarrass the other. Do not both form parts of one great system? Is it not for the common welfare that both should flourish abundantly? Does not the maintenance of America's commercial supremacy rest upon them both?

There can be but one answer to these questions. It is as essential that we have swift and economical transit of freight by land as by water. The United States is, approximately, 1,600 miles long by 2,800 miles broad. This immense area forms one of the greatest agricultural, mining and manufacturing centres on the face of the globe. Great as it is, its development is still very partial and incomplete. In the South alone, it is doubtful whether half of the soil is under cultivation, while a mere fraction of the water power is put to service. Even in the older sections, there is an advance in population, silently going on every year, which gives evidence of how much room we still have for expansion, both East and West. For instance, take New England. It is common to speak of it carelessly as a stationary or even decadent part of the United States. Nothing could be more erroneous. In the decade from 1900 to 1910 little Rhode Island, with its 1,250 square miles, actually increased in population at the rate of twenty-six per cent.

In the same decade, Massachusetts increased twenty per cent, against Ohio's fourteen per cent. But great as has been the increase in population, it is moderate compared with tonnage and production. In almost the same period already mentioned (1901-1911) the tonnage of the Pittsburgh district alone grew from 64,125,000 to 152,000,000 tons. Other sections would show figures nearly as impressive. The South is mining almost twice as much coal to-day as the whole country mined in 1860. She has $700,000,000 more capital invested in manufacturing than the whole United States had in 1880. Everywhere the country's growth has been immense.

In the face of such an expansion and development, is it not of first importance that we be able to move our goods at the very lowest possible charge? The cost of transportation is a part of the cost of every commodity we buy. More surely than any customs duty does the price of transportation enter into the ultimate cost of every finished product. The Industrial Commission found that it cost the American farmers more to merely move their produce to market or to the nearest railroad station than the entire operating expenses of the whole railroad system of the United States for the year 1898. Think, for a moment, what this means. The average haul from the farm to the nearest shipping station was, so the Commission found, twelve miles over country roads. The cost of carrying the farm produce of the [illegible] country this short distance was $3 per
[illegible] a total of $900,000,000 for truck-
[illegible] as against $818,000,000 for the
[illegible] all our railroads for the
year [illegible] suggestive of the impera-
tive need of rail[illegible]nsion and improvement?

roads will prove as vitally important as our merchant marine or our inland river steamboats and canal barges, and probably much more so. It is necessary that transportation by land be as swift, as adequate, as cheap and as reliable, as transportation by water. The railroads must bear the brunt of the work of collecting and moving goods from the interior to the seaboard and vice versa. The utmost extension of navigation on our rivers and canals, even if developed on the grandest and most sweeping plans now dreamed of by ardent members of waterways conventions, can never do away with the need for cheap railway transportation. The railroads can go everywhere and connect with everything. The waterway is possible only along the line of a limited number of routes. Its first costs of construction are often prohibitively onerous; its maintenance is very heavy; and its period of open navigation is restricted by cold and frost. Moreover, the waterway is now generally found seeking government aid or subsidy. The railroad simply asks to be let alone. It can live and prosper, if it can receive treatment that is half way fair. Is it not for the best interests of the American people to see that they have it? As wisely observed by President Wilson in his letter of September 10th to Chairman Trumbull, of the Chesapeake and Ohio Railroad, the "imperative need that railway credits be sustained, and the railroads helped in every possible way, whether by private co-operative effort, or by the action, wherever feasible, of governmental agencies" is *"very real."* The Nation seems determined to drive two horses in its business team—railways and waterways. If they are to pull evenly on the traces, we must treat each horse fairly. We must not feed one on oats, and the other on wire grass, and then expect each to draw his share of the load.

Strangling a Vast Industry

NOTE: The following paragraphs are from an address delivered by Ivy L. Lee, Executive Assistant of the Pennsylvania Railroad on November 20th, before the Young Men's Club of New Brunswick, N. J.

THE railroads in this country are caught in a vise which is being screwed tighter and tighter. Railroads do not oppose proper regulation, but is it not time to inquire whether regulation is not gradually becoming strangulation? Many are the signs now that the grip of cumulative regulation is slowly but surely squeezing out the life-blood of what President Wilson has called "the one common interest of our whole industrial life"; that it is scotching initiative and enterprise; and that it is undermining the ability of the railroads to provide for future public needs.

In our treatment as a people of the railroad question, we are obeying literally the scriptural injunction, "Take no thought for the morrow." "The railroad is here," we reason. "It cannot run away; let us get all we can out of it now, because—may be, its stock is watered!"

Mr. Prouty said before the National Association of Railway Commissioners in Washington on Wednesday: "Grave doubts exist as to whether rates must not be generally increased." And then he added, "The question cannot be satisfactorily answered until there is a national valuation of these properties." And Mr. Prouty himself predicted that this valuation would not be arrived at until 1919.

Regulation of railroads—so eminently desirable, when proper and not merely political—was originally to prevent discrimination and oppression. In no respect is anything else intended now, but the cumulative effect of laws and commission activities is that this device of statesmanship is being converted into an instrument of torture. In what manner that is true may be realized from the following:

Many States insist upon approving the terms of security issues.

New Jersey insists that grade crossings shall be removed at the sole expense of the railroad. At the meeting of the National Association of Railway Commissioners in Washington on Thursday, Commissioner Hall, of Nebraska, is reported to have urged that a "concerted effort should be made by all commissioners in all States that grade crossings should be eliminated at no matter what cost to the railroads." To remove all the grade crossings in the United States would probably cost $5,000,000,000,—one third of the present total investment in our railroads.

Commissions may order improved stations and the installation of signals; they may tell you where you must and when you cannot stop a passenger train.

They pass upon the quality of the locomotive boiler; they prescribe the character of headlight; they stipulate the kind of ash-pan; and the State of Indiana has now decreed that an automatic door be used on the locomotive firebox.

The law sets forth where the ladders, bars and other safety devices shall be placed on freight cars.

Commissions decree whether on mountain grades you shall use hand brakes, holding the air brakes in reserve, or air brakes, holding the hand brakes in reserve.

Federal laws stipulate the number of hours men shall work; States tell you how often you must pay your men, and many State laws fix the number of men in a train crew.

The process of manufacture of steel rails and the kind of ties used, are still matters for which railroad officers are responsible, but at the meeting in Washington an Interstate Commerce Commissioner called attention, as to an omission requiring repair, to the fact that "railway *material* is in general notable for its exemption from all supervision of any kind, State or Federal."

There is pending in Congress a law limiting the number of freight cars which may be hauled with one locomotive. At the meeting of Commissioners in Washington, a committee recommended that the Interstate Commerce Commission be given full authority to prescribe "the character of equipment to be used in interstate commerce, also authority to prescribe the manner of using or hauling same."

And the most amazing feature of this whole process is that actual experiences in the successful conduct of railroad affairs apparently disqualifies a man from appointment to a railroad commission.

In 1913, nearly 1,400 laws regulating railroads were introduced in 42 State legislatures. In 1914, only 14 legislatures were in session; but 236 new railway bills were proposed. Of these, 112 provided for some mandatory concessions to employes.

Arbitration commissions establish the rates of wages which shall be paid to employes, but assume no responsibility for obtaining the money with which to pay them.

Local authorities assess railway taxes, but these authorities have no power to help the railroads assess charges out of which to pay these taxes. On the Pennsylvania Railroad in the past fourteen years total wage payments increased 160 per cent and taxes increased over 200 per cent.

Perhaps expenditure for all these purposes is desirable, but it is certain that it cannot be made unless the railroads receive higher charges for the services they render—and the railroad company is concerned only that returns as a whole shall be adequate.

Nevertheless, a non-political Congressional committee reports that the railroads are underpaid for carrying the mails; but Congress takes no steps to provide the additional money.

Many States arbitrarily limit both freight and passenger rates. But even where that is not done, higher rates can only be obtained with the sanction of railway commissions.

Thus hemmed in between Scylla and Charybdis, the railroads have run aground on a long-charted and well known rock, known as the arithmetic table. In concrete form this is how the danger has manifested itself:

During the four years from June 30, 1910, to June 30, 1914, the thirty-five railroad systems east of the Misssissippi and north of the Ohio River expended for improvements nearly $900,000,000. Yet, such was the increased expense of handling business that in the fiscal year 1914 these railroads earned net operating income less by $90,000,000 than in 1910, before that cash investment had been made.

Must it not be apparent that had investors in the past realized the treatment they were to receive, they would not have provided the money for the building and development of our railroads?

And as the money for future railroad development must be supplied by private capital, is it not time that we took some thought for the morrow?

The Personal Injury Problem

BY GEORGE BRADSHAW, SAFETY ENGINEER, HIGHLAND, N. Y.

NOTE: The following paragraphs are taken from an address delivered by Mr. Bradshaw before the November meeting of the Western Railway Club. Mr. Bradshaw is an expert in his line and his address constitutes one of the most comprehensive brief statements of the various elements which enter into the railway safety movement, that has yet been published.

THE necessity for educating public sentiment is shown in the number of trespassers killed on railroads. More than 50 per cent of the entire number of persons killed on railroads in the two countries are trespassers. Sixteen people are killed in this way for every day in the year. This is simply wholesale slaughter and slaughter, too, from a risk which it is unnecessary to incur. While there are laws in Canada and some of the States prohibiting trespassing on railroads, no one pays any attention to them. There seems to be an impression abroad that hoboes and tramps constitute the trespassers killed on railroads; but the truth is that perhaps 80 per cent of such persons are useful citizens with fixed homes, laboring men walking along tracks or riding cars to and from their work, business men and, in fact, the public generally using railroad tracks as a convenient pathway, persons picking up coal in yards and children "flipping" cars. In other words, the railroad trespasser is the average citizen. The real sufferers are the dependent families of the victims; but the publc also suffes, first, in being deprived of the services of those killed and maimed and, secondly, in the increased burden of caring for those who are thereby made destitute and helpless.

The railroads are powerless to control this situation. It will continue till public sentiment puts a stop to it. Some of the roads, among which the Grand Trunk and the Grand Trunk Pacific are prominent, are endeavoring to educate the public to observe safe standards of conduct when about railroads and to discontinue the practice of trespassing. With this purpose in view they have safety precautions printed in their public timetables and posted in stations and other public places, occasionally articles in the press, and often hold safety meetings to which the public is invited. We are now arranging to start a campaign of safety in the schools by giving to every boy and girl one of the "Safety Buttons" you see on exhibit at this meeting and by having their attention called to the great danger of walking on railroad tracks and playing on or about cars.

It is gratifying to note that since the railroads started their vigorous campaign for greater safety, commercial industries, public service corporations and cities and towns from one end of the country to the other have fallen into line with the result that more is to-day being said and written —and *done* for the prevention of injuries than ever before. But we have really only begun. What is needed both in Canada and the United States—for conditions are identical in the two countries—is a department of government, or perhaps a bureau in some existing department, for the purpose of interesting and educating the public in matters pertaining to safety, not by issuing volumes of statistics and long technical reports; but by systematic instruction in schools, readable topics in the public press, notices posted along highways, moving pictures and lectures.

Let us now consider this problem in its relation to passengers. The one purpose of railroads is to transport persons and property, and their first duty is to conduct such transportation with the highest reasonable degree of safety to their patrons. So far as the safety of passengers is concerned there is really no problem, except, as already indicated, the problem of educating people to a better observance of safe conduct in their own actions over which the roads have no control. The record shows that there has never been a mechanical device of determined merit invented nor a method of operation of known effectiveness proposed that would reasonably insure greater safety to the traveling public that the leading railroads of our countries have not adopted as promptly as consistent with a thorough determination of merit and that the other roads—the smaller and weaker ones—have not adopted as fast as their ability permitted them to do so. Until recently we heard a great deal about automatic train stops. We don't hear so much now, because the American Railway Association, after a careful consideration of the subject, expressed an opinion as to what such a device should and should not do under various conditions in order to be reliable and effective; and one railway system offered a reward of $10,000 (which has not yet been won) to the person who would construct an automatic train stop to meet certain specified and necessary tests. One leading road has already installed the wireless telephone on its trains. If it proves serviceable, other roads will soon follow the example and in a reasonable time such device will be a regular part of the equipment of every road that can afford it. Four years ago the safety movement was developed and having proved effective, it has now been introduced on more than half the mileage of the two countries. And with only a very small percentage of exceptions, these devices and methods have been introduced voluntarily and not as a result of compulsory legislation.

As a consequence of this record, travel on railroad trains had become not only safe, but safe to a most remarkable degree. Mark Twain once said that it is safer to travel than to stay at home because so many more people die in their own beds than on trains. And it is literally true that "it is safer to travel than to stay at home." Insurance companies prove this to be so, because one can secure for the same premium double the amount of indemnity against death from train accident as from accident in an ordinary occupation or from accident even in one's own home.

I am not seeking to justify preventable wrecks which we all know do occur now and then and I have something to say about that particular phase of the subject later. But let those who may be inclined to pass harsh judgment upon railroads for these unfortunate occurrences first consider upon what a multitude of elements, conditions and combinations the safety of every train depends. First, there is the human element. A hundred, perhaps a thousand, men with individual duties requiring performance in a particular manner, at a particular time and place, separated by miles, yet all working together. It's so easy to make a mistake, even when one is trying to do his best—to misunderstand, to forget, to neglect some little detail, to use poor judgment—and yet a single error on the part of one man—just one in a hundred, or one in a thousand—may result in a train accident. Now, multiply your own personal liability to error by that of 100 or 1,000 and that by 60 by 24 and by 365. Then, there is the physical element. Ties, rails, bridges, embankments, grades and curves. Millions of bolts, bars, beams, and braces, links, levers, staples and spikes, a flaw in even one of which may possibly cause a wreck And yet in spite of all these circumstances, last year 209 companies operating arpproximately 121,000 miles of road, carried in round numbers 410,000,000 people—more than four times the combined population of the two countries—*without killing a single one in a train accident.*

Coming now to employes. Of the 205,000 persons injured on the roads of the two countries last year, 174,000, or 85 per cent, were employes. This is within a few points of the ratio from year to year. It is evident, therefore, that here is the real personal injury problem with the solution of which the Safety Movement on railroads is chiefly concerned.

An exhaustive analysis of thousands of cases of injury occurring from year to year over an extensive mileage, under all possible conditions and to all classes of employes has shown, first, that from 60 to 70 per cent of such cases are preventable and, secondly, that of those which are preventable, 80 per cent of them are due, not to improper or inadequate physical conditions or appliances, but to the employe's lack of knowledge of safe methods or to his indifference to the use of such methods. This may not be pleasing information to employes, but it is absolutely true. They are by no means chargeable with entire responsibility for its being true. Men are no better than they are educated and trained to be.

We have been taking it for granted that employes should as a matter of course know the safe and unsafe ways of doing their work. We have assumed that they know it to be dangerous to go between moving cars, to kick a drawbar to make coupling, to stand between apron of coal chute and cab when taking coal, to strike tempered steel with a metal object, to use "mushroomed" chisel or hammer, to throw boards about with points of nails projecting upward, to leave a baggage truck at edge of station platform, to use a track jack between the rails of main track and scores of other apparently simple things. Not only have we assumed that employes know the safe and the unsafe methods in performing their routine work, but we have also assumed that, without any special instruction on this subject, they would of their own accord take the safe course. The best proof that these assumptions are not well founded is the fact that employes are continually getting injured and killed doing things in an unsafe manner which they could just as well do in a safe manner. An engineer had some fingers blown off while screwing down the cap of grease cup on side rod due to explosion of fusee powder which he had put in to cool the cup. A storehouse employe used a lighted torch to locate a leak in a gasoline tank. He located the leak all right, but there was afterwards difficulty in locating the employe. A trackman, finding a torpedo, held it on the rail and struck it with his pick to find out what it would do—and he found out. Only a few days ago a sectionman—an English-speaking person considerably above the average in intelligence—was burned to death in attempting to start a fire with kerosene. While, of course, these examples are somewhat out of the ordinary, cases of a more routine and less impressive nature, yet due to the one cause of ignorance of safe methods, are occurring by the hundreds every day.

It is believed that there is but one way to prevent injuries from this source and that is to educate employes in the safe methods of doing their work. This is one of the purposes of the Safety

Movement and I will now ask your attention to a short illustrated talk on "Safe and Unsafe Methods for Railroadmen" which will give you an idea of how we are going about this matter.

(This part of the address was followed by a series of fifty stereopticon views showing unsafe and safe practices and conditions with explanation and comment.)

The most important and the least considered factor in railroad operation is the human element. This element is responsible for four times the number of preventable injuries and deaths and four times the amount of avoidable damage to property as all other elements combined. Yet it receives not one fourth nor one fifth nor even one tenth of the attention given to other elements. We spend immense sums in selecting, grading and testing materials and when we have built the best track and turned out the best engines and cars that money can produce, we depend, in selecting the men who are to operate this perfect equipment, upon the broad experience, the ripened judgment and the profound knowledge of a clerk in the superintendent's or trainmaster's office who, with the exception of the doctor making the physical examination, is often the only person connected with the road having anything to do with the applicant till he has been set to work. It's all right and proper to educate employes in the safe methods of doing their work, in the manner which I have indicated, but we have not yet gone at this proposition in the most logical and effective way. What we should do is to use more care in selecting the employes to be trained. There is no industry which is in a better position to demand and secure a high type of employe than the railroads, because, in the first place, there is a certain fascination about railroad work which appeals to young men and because the pay, especially in train service, is exceptionally good and the prospects for promotion are encouraging. Yet most railroads fail to avail themselves of these favorable opportunities. We often hear it said when business is particularly heavy that we "have to take anything we can get." That's true under present methods of employment, but the railroads are entirely responsible for its being true. The cleanest and most capable young man in the country may apply for a job braking or firing and if we don't happen to need him at the time, he gets little consideration, often only scant courtesy. He goes somewhere else and gets employment and then when business picks up and we have to have men, we have no waiting list—we don't even bother to take the name and address of such men,—and that's the time we "have to take anything we can get."

While the great body of railroad employes will compare favorably with other classes of men, yet it is true that we have in our ranks too many who belong to the "anything we can get" class. To expect the Safety Movement to make safe men out of some of the human material engaged under our present methods of employment is about as reasonable as it would be to buy rotten ties and expect to make them serviceable by some kind of treating process.

I believe we should insist upon an educational qualification, at least equal to that of the eighth grade, for all employes entering train, yard, station or telegraph service. When an applicant has satisfied the educational and physical requirements, he should be subjected to a most rigid character investigation by some officer assigned particularly to this work to whom all applications, in these branches of the service, should be referred and who would be able to keep a list of eligible men to be drawn upon as needed.

The great importance of the selection and training of men is indicated by the report of the Interstate Commerce Commission for the year ending June 30, 1913, in which it is said:

"The Commission again is compelled to note the exceedingly large proportion of train accidents due to dereliction of duty on the part of employes. Fifty-six of the accidents investigated, during the year, or nearly 74 per cent of the whole number, were directly caused by mistakes of employes. These mistakes were of the same nature as those noted by the Commission in its last annual report, namely, disregard of fixed signals; improper flagging; failure to obey train orders; occupying main track on time of superior train; giving lap order or using wrong form of order; excessive speed; failure to identify train that was met; leaving switch open in face of approaching train."

We have heard and talked so much about safety devices that we have largely overlooked the human device. We string our tracks with automatic signals which can't give an unsafe indication once in ten thousand times. Yet let an engineer through inattention, run one of these signals and cause a serious train accident and the newspapers, politicians and the public begin to clamor for more safety devices. They want flash lights in the cab, audible signals added to the visible and automatic train stops. As has been said, there would be just as much sense in equipping automobiles with fenders to prevent reckless drivers from striking people.

The Interstate Commerce Commission contends that there is need for more official supervision directed specifically to matters of safety. Perhaps there is some foundation for this position as conditions now exist. But the ultimate solution of the problem depends not upon more official supervision, but upon more careful selection and more thorough training of employes, together with a more rational and certain method of administering discipline whereby those who wilfully violate safety rules and instructions will be removed—*and kept removed* from the service before, instead of after, they have injured or killed somebody.

It should not be supposed from what has been said that the Safety Movement is simply a "please be good" campaign to be conducted by distributing literature and delivering lectures. If it went no further than that, not a great deal of good would be done. The brass band, speechmaking, notice writing, sign painting, button wearing propaganda, with nothing to go with it and back it up, is like the turkey gobbler,—"hell on dress parade, but not worth a damn in a fight."

There should be on every road of considerable consequence a competent man in charge of safety matters to which he should give his entire time and attention and be responsible solely to the chief operating officer. Here is where some roads have made a mistake. They have started this work with a whoop and a hurrah and then turned it loose to shift for itself or tacked it to some existing department to be conducted as a side issue. You can't get results that way: and unless a road is going to start this work right and push it vigorously, there is little to be gained in starting it at all.

The safety engineer should be a man whose knowledge of railroad affairs is such as to make his advice valuable to the heads of departments in matters relating to safety. He should understand the history, reason and proper application of all standard rules, especially those pertaining to train orders and the movement of trains. He should be thoroughly familiar with the application of standard rules and of safety regulations and devices in general on the leading roads. At frequent intervals, he should make inspection of shops, roundhouses, yards and terminals and occasionally an inspection of the entire line. He should merit the confidence of employes and spend much time discussing matters of safety with them and instructing them in the safe methods of doing their work. He should be able to detect unsafe methods and conditions and be prepared to show how they can be made safer without unnecessary interference with operation.

Perhaps it may be said that the officers in immediate charge should note and correct unsafe practices and conditions. They do make correction to a considerable extent; but they can't carry this work far enough. Their best thought and energy are given to volume of output for the simple reason that there is where the strongest pressure is brought to bear upon them. As a general rule they do the best they can under the circumstances; but this is the day of the specialist and the safety engineer is a specialist.

Let me now refer to an objection sometimes urged against the advisability of creating a separate branch of the service in the interest of safety, namely, that it interferes with departmental organization. The best answer to this objection is that it does not interfere. Let those who claim that it does, investigate the working of the plan on the leading systems of our two countries. Broad gauge railroad men—and most of them belong to that class—work on the principle that the interests of the road and not those of their departments are of paramount importance. They understand that an impartial and competent person looking at matters from an independent point of view may see many things which would escape their attention. Men of this caliber welcome the assistance of the safety engineer because they know that before he can possibly make a favorable record for himself, he must first help them to make a favorable record.

The Movement has been in effect on the Grand Trunk Railway for about fourteen months. Comparing months since the work was started with corresponding months before (the volume of traffic being about the same in each case) shows a decrease of 11.5 per cent in the number of employes injured and a decrease of 50 per cent in the number of killed. There has also been a most noticeable decrease in the number of injuries sustained by patrons and travelers on highways.

The indirect results attributable to safety work have also been most gratifying. For example, the superintendent of one of the large terminals advises that since the work was started there has been a decrease of about 50 per cent in the damage to equipment from rough handling. In the terminals referred to, during last January and February, 46,000 cars were handled without one dollar's damage to even a drawbar.

The following statements show results of the Safety Movement on some of the important lines.

Chicago and North-Western.

During the four years ending June 30, 1914, compared with the four years on same basis ending June 30, 1910, there was a decrease of 32 per cent in employes killed and a decrease of 26.5 per cent in employes injured; a decrease of 21.8 per cent in passengers injured; a decrease of 18.7 per cent in outsiders killed and a decrease of 6.6 per cent in outsiders injured.

Northern Pacific Railway.

A decrease of 73 per cent in the number of employes killed and a decrease of 17 per cent in the number of employes injured.

During the year ending June 30, 1914, as compared with the previous fiscal year, there was a net saving in expenditure on account of personal injuries of $40,916.17.

Delaware, Lackawanna and Western.

Employes injured first six months of—	
1911	137
1912	121
1913	109
1914	99

Employes killed first six months of—	
1911	34
1912	21
1913	19
1914	7

Canadian Government Railways.

A decrease of 22 per cent in the number of employes injured and a decrease of 60 per cent in the number of employes killed.

St. Louis and San Francisco.

During the three years immediately following the introduction of the Safety Movement, as compared with the three years immediately before it was introduced, there has been a reduction in casualties to all classes of persons of 23 per cent.

Examples of this kind could be greatly extended. The Safety Movement is no longer an experiment and asks now to be judged, not by promises, but by results.

The Parcel Post and Its Effect on Railway Revenues

On November 20th, Mr. J. V. Bradley, general supervisor of mail traffic of the Pennsylvania Railroad, addressed the members of the New York Railroad Club on the above subject. After reviewing the history of the discussion which terminated in the establishment of the parcel post and the important changes made by postal regulations after it became effective, Mr. Bradley refers to their effect upon express revenues in 1914 in the following manner:

"The statistics are not yet available to show the gross revenues of all express companies for the year ending June 30, 1914, and we are therefore, obliged to confine our study to the returns of the Adams, the American and the Wells-Fargo companies. These combined, represent nearly 70 per cent of the revenues and 65 per cent of the mileage of all express companies. For comparison, the figures are given since 1909:

Year	Revenue	Increase	Per cent
1909	$85,221,247	....	.....
1910	94,458,068	$9,236,821	12.01
1911	99,705,808	5,247,740	4.44
1912	110,372,802	10,666,994	10.69
1913	117,965,952	7,593,150	6.87
1914	110,579,322	D7,386,630	D6.26

"If the revenues of these three companies for 1914 had shown the same growth as between 1912-1913, they would have been $125,000,000.

"Part of the deficit is due to the reduced rates ordered by the Interstate Commerce Commission to take effect February 1, 1914, but how much? One prediction was that the Interstate Commerce Commission's order would result in a reduction of 22 per cent. As the reduced rates were in effect only five months of the year, this would be equivalent to 9 per cent, or about $11,000,000. This amount subtracted from $125,000,000, leaves $114,000,000. Comparing this with the actual earnings of about $110,000,000, leaves $4,000,000 to represent the maximum amount that could be regarded as due to parcel post competition Another prediction was that the new Interstate Commerce Commission rates would reduce the express companies' revenues by 17 per cent instead of 22 per cent. Applying our calculation in the same way, we would get as a result that the loss in 1914 on this account was $8,750,000, leaving the maximum loss attributable to parcel post competition about $6,000,000.

"While our attention is concentrated upon the two positive causes which would indicate probable loss of revenue in 1914, namely, the Interstate Commerce Commission order and the parcel post traffic, we necessarily assume equality in other conditions entirely outside of these two causes which might have a serious effect upon the revenue. For instance, business depression, which has caused a general falling off in railway revenues, would no doubt have a similar tendency in connection with express companies' revenues. It would, therefore, be rash to assume that the loss of from $4,000,000 to $6,000,000 in the business of these three companies is chargeable to parcel post competition, but if we take the lower of these two amounts, $4,000,000, as possibly indicating the loss to these three companies, we could logically assume that the loss to all of the express companies in the country from the parcel post competition during the year ended June 30, 1914, was about $6,000,000, or say about 3 or 4 per cent.

"In connection with our estimate that all the express companies together lost $6,000,000 by parcel post competition during the year ended June 30, 1914, we might venture another guess as to the number of pieces lost. The Interstate Commerce Commission's table of express statistics gave an average revenue per piece of 50 cents, but this is based upon all weights and distances. The active competition of the parcel post is from 1 to 11 pounds, and from the first to the third zone The four-pound package would be the typical average, for which the express rate to the third zone would be about 25 cents. This would make the loss in pieces about 24,000,000 for the fiscal year 1914. In other words, the loss of the express companies was seemingly about five or six per cent in pieces and about three or four per cent in revenue. If the express companies lost $6,000,000 in revenue, the railroad companies would lose approximately one half of this or, say, $3,000,000.

"The ton mileage of this mail in 1913 would, therefore, have been about 84,000,000. The Post Office Department reported to Congress as of April, 1913, a ton mileage for all mail of $510,000,000. The addition was, therefore, about 15 per cent in that year and even greater in 1914.

"The only action by Congress towards compensation was an allowance of 5 per cent increased pay to the railroads until the mails were weighed in regular course, but this weighing is only made once in four years The 5 per cent allowance amounted to $1,687,360, although the additional revenue received by the Post Office Department from the first year's new business was estimated at about $15,000,000.

"The railroads are now awaiting action by Congress on their petition for a remedy of this condition. They ask specifically for annual weighings instead of quadrennial weighings; for extra pay on account of the apartment railway post office cars they are obliged to provide and for relief from the messenger service between railroad depots and post offices which has been required of them for many years.

"As against these simple reforms, the Post Office Department has urged the enactment of a law to pay the railroads on the basis of car space as they might authorize it, and at rates per car mile considerably below the average car mile earnings of passenger train service. The railroads' representatives have opposed this proposal, both as regards the rates and the system and have explained to Congress the administration difficulties which make the plan impracticable as well as dangerous for both the Government and the railroads.

"We confidently hope that Congress will prefer to pass a few simple amendments in the existing law to perfect a system which has been in operation for about forty years, rather than to pass a new law on a totally different and experimental basis which would abandon the safeguard to both parties through the knowledge of the actual weight of mail transported at the very time when the Government is developing through the parcel post a system of transporting heavy merchandise in competition with the existing agencies owned and operated by its own citizens.

"To conclude the study of the effect of the parcel post upon the revenues of the railroads, it may be said:

"1. That so far as the railroad revenues are reduced at the present time because of the reduction in the revenues of the express companies, this is more due to the new rates prescribed by the Interstate Commerce Commission than to the competition of the parcel post.

"2. The parcel post, by the creation of a large amount of new business as well as by taking some business from the express companies has greatly increased the tonnage of the mail transported without any adequate provision for the payment thereof to the railroads that are performing the service. It is of great importance that such remedial action be taken promptly, not only because justice to the railroads requires it, but also that the Government may obtain information as to the full cost of performing the parcel post business. The knowledge of the full cost of transporting the parcel post business will save Congress from approving of parcel post rates which would result in a heavy increase in taxation, unless Congress in representing the people should deliberately decide to decree general taxation to pay for the performance of a public service, the benefits of which would only be slightly enjoyed by the ordinary citizen, but which might be largely monopolized by the mail order houses and other great business establishments."

The Handling of Snow and Care of Track in Winter

NOTE: The management of the Canadian Northern Railway recently offered a prize to the roadmasters of its lines in Quebec and Ontario for the best paper on "The Handling of Snow and Care of Track in Winter." The first prize was won by R. J. Monroe, roadmaster at Joliett, Que., whose paper is herewith presented:

IN dealing with this subject I will endeavor to put in a concise form the methods, which, in my opinion, should be employed in order to obtain the most economical, safe and efficient results. Trackmen's work in winter consists practically of but two units, the clearing or removal of snow and the maintaining of track.

The handling of snow in the Province of Quebec, due to its geographical location, is a difficult problem, requiring thorough organization and the co-operation of all those engaged in the operating department.

With the approach of winter a portion of the ballast should be removed from between the ties around all moveable parts of interlocking plants, switches, etc. This is essential in order to facilitate the removal of snow and ice from these parts during the winter. The ends of all crossing planks that remain intact during the winter should be tapered off, in order to minimize as much as possible the damage that would result from flangers catching them while in operation.

The roadmaster, after personally inspecting all snow plows and flangers assigned to him, and having them equipped and made ready for service in good season, should consult with the superintendent and arrange for the proper distribution and assignment of this equipment. An experienced and competent foreman, thoroughly familiar with the district to which he is assigned, should be placed in charge of each snow plow. He should also be familiar with adjoining districts, so as to be in a position to operate over same in case of emergency.

Each snow plow foreman should make several trips over the division every autumn, in order to become familiar with the location of sidings, interlocking plants, etc., which is essential in the successful operation of snow plows. He should also take particular notice of any changes that have been made since the previous winter, such as the installation of new side tracks, or the lengthening of old ones, etc.

At the beginning of the winter the track should be kept clear of snow as long as possible, by the operation of wing flangers on freight or mixed trains, thus avoiding the extra expense of running plow extras. As the season advances and the snow becomes heavy and cuttings get filled, necessitating the operation of snow plow extras, the roadmaster and supervisor of track must keep in touch with the superintendent and chief dispatcher, keeping them well posted as to the condition of the road, and arrange for plow extras when required, and in this respect it is imperative that snow plow extras be run promptly when ordered, and that the best available power be supplied for them. Experience has taught us that failure to promptly operate snow plows during heavy snow storms has resulted in serious blockades, with the ensuing result of congestion of traffic and extra expense all round.

On the return trip of snow plow extras from their operation over the division, or immediately after snow storms, plow extras should be used in winging out and widening the bad cuttings and for plowing out all passing tracks and other through sidings. The prompt and proper handling of snow in passing tracks and sidings, by the use of snow plows, reduces the cost of hand labor, and in addition permits the more prompt handling of traffic after each snow storm, as trains can meet without delay, and cars can be promptly set out or picked up from business tracks.

In heavy cuttings, as well as in certain places in the open country, snow very often accumulates from continual drifting, and in this respect section foremen must thoroughly familiarize themselves with their sections. It is important that they watch closely all such places and give timely advice to the train dispatcher's office, as well as to the roadmaster and supervisor of track, as soon as snow accumulates in such places, so that trains, especially heavy loaded freight trains, may not be permitted to run into such places and become stalled, thereby seriousely delaying traffic. They should keep the snow in all such cuttings well shoveled back, so that snow plows during snow storms may successfully operate through them with wings in full operation.

The handling of snow at the larger terminals forms a heavy item of the snow expense, and while no adequate means have been devised for doing this work, except by hand labor, still a great deal can be accomplished by the use of flangers. Foremen in charge of terminals must watch snow expenses very closely and not employ more men than is absolutely necessary. This is particularly so at the beginning of the winter, when the first falls can be handled with a small gang of men and with very little inconvenience to traffic, as the flange is generally clear of ice and hard snow and yard engines can operate with greater ease than later on in the season. Tracks and switches around locomotive houses, water tanks and shops demand very close attention on the part of section foremen. Ice quickly accumulates at such places and unless watched very closely, becomes a cause of derailments. Section foremen in charge of important terminals should keep in touch with the unemployed labor, so as to be in a position to secure extra men on short notice.

Shimming is another problem which trackmen have to contend with. The extent to which track heaves varies according to the nature of the soil in the subgrade, the amount of ballast underneath the track and the drainage. With a liberal supply of ballast shimming can be reduced to a minimum. It is my experience that the results obtained from shimming do not depend so much on the number of shims applied each day, as the applying of them in the most needed places. When track heaves badly the section foreman should select the worst spots on his section and do the necessary shimming promptly, in order to keep the track in a safe condition for the passage of trains. Some foremen, especially the inexperienced, find it rather difficult to select the worst places and very often spend valuable time and material doing unnecessary work. In order to avoid this the supervisor of track, when traveling over the division, should keep a sharp lookout for rough track and note the extremely bad places on each section and promptly advise the foremen, giving them the exact location of each spot. By doing this regularly all unnecessary shimming will be avoided and the track will show a marked improvement each day.

Spread track, except on sharp curves, is invariably caused by defective surface and line. When track shows signs of spreading, trackmen should at once set to work to remove the actual cause, instead of driving a few extra spikes and leaving the track in bad line and surface, with the result that the track will again spread from the same cause in a day or two.

When leaving for work in the morning the section foreman should always have in mind the places to be shimmed on that day and see that he has the necessary material with him.

When shims exceed half an inch in thickness spikes should be pulled and driven through them. When shims exceed 1½ inches, sufficient long spikes and braces must be used to ensure safety. When shims exceed 3 inches, long shims must be used and an occasional one spiked to the ties.

The most critical time is in midwinter, when snow storms are frequent and of long duration. At such times trackmen find it very difficult to do any shimming and track will continue to heave badly. Bad spots will develop that will become dangerous within a very short time if not attended to. Supervisors of track must watch this even more closely in such weather and keep a sharp lookout for such bad spots and insist on having them attended to at once.

As soon as the snow has disappeared from around the rail, section foremen should go over their section and spike all short kinks into line and shim up all spots which are liable to cause spreading.

We now arrive at the season when the frost will show, signs of coming out and shims will "show high." A great deal of rough track at this season can be attributed to two causes, the principal one is that of allowing shims to remain "high" for a certain length of time in order that they may be all taken out at one "pulling." The other is the lack of doing the needful shimming around frogs, crossings, etc., where the frost is retained a longer period. Some foremen neglect this important matter with the expectation that the frost will disappear in a day or two, when in many cases it remains for weeks. As soon as shims "show high" they should be reduced or removed, as the circumstances demand, and the material used elsewhere, such as around public crossings and frogs, as mentioned above.

Where track heaves badly, such as in cuttings, the section foreman should examine it frequently by walking over it and sounding the ties, as the frost is liable to drop out suddenly, leaving a serious defect which is not noticeable on the surface of the rail. Such track as this cannot be inspected properly on a hand car.

All switch ties should not be filled up to insure a uniform departure of the frost and to prevent them getting slack.

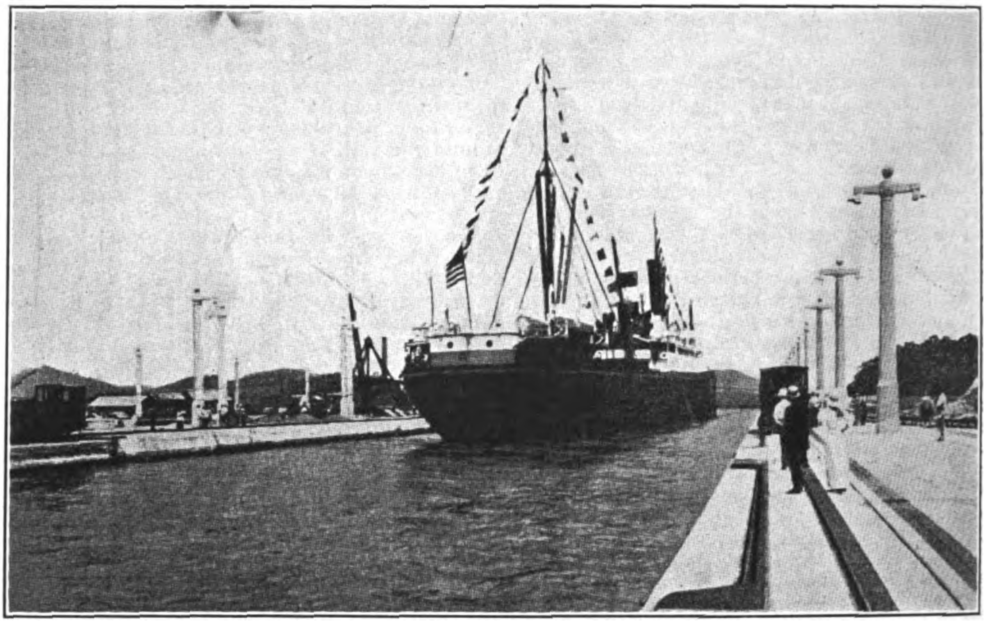
One of the most important matters is a daily patrol of the entire section by a competent trackman. This is especially so during stormy weather. It is his duty to keep a sharp lookout for a spread track, broken rails, etc. A very important matter and one that must not be lost sight of by foremen and supervisors of track, is the accumulation of ice in rock cuttings, side hills, around cliffs, or at any other points where the track is liable to be flooded during soft and rainy weather.

The Panama Canal and the Railroads

NOTE: The following article by John Maurice Clark, appears in the Panama Canal supplement of the *New York Commercial and Financial Chronicle* and is presented herewith by permission of the publishers.

AMONG the many questions raised by the opening of the Panama Canal, not the least interesting will be the effect of this great new waterway on the greater common carriers, the railways, to which it will appear in the two-fold guise of teammate and competitor. It will develop some new traffic in which the railways will have a share; it will take some of their present traffic away from them, and some traffic will be shifted from its present course, and will run in new channels. All this will bring gains to some carriers, possibly losses to others, while to most it will bring gain and loss commingled.

We expect an increase in our export trade to the west coast of South America and the Orient. Exports, moreover, must be paid for with imports. Now the greater part of the exports and imports must be carried by rail, some distance at least, and the profits on this business will be one of the benefits which the Panama Canal will bring to the railroads. For much of this commerce, New Orleans is the natural port, and, in proportion as New Orleans comes thus into its own, the railroads which serve that port must share in its prosperity. Not only in foreign trade does New Orleans expect great growth, but in trade to the Pacific Coast of the United States itself, diverting traffic from the overland routes. Thus the Illinois Central and the Louisville and Nashville may become competitors of the Union Pacific or even of the Great Northern. The strictly north and south lines are not, however, the only ones to share in this traffic. The Rock Island controls a route from Chicago to Galveston, and the Frisco system also includes a Gulf connection. Thus these western transcontinental



The First Large Freight Steamer Through the Panama Canal.

roads, which are exposed to the most direct losses from the competition of the canal route, have at least some small chance to participate in gains as well.

So much for the commerce of the Gulf ports. What of the transcontinental traffic and carriers? These roads are clearly liable to very definite losses from the opening of a great new waterway which must inevitably strengthen the competition for business from coast to coast—a waterway through which their own ships may not pass.

Aside from the general, normal growth of business, there will undoubtedly be some business which the canal itself will create. Indeed, there will be a sort of rough, natural compensation at work by which, the more traffic is taken from the roads, the more of other sorts of traffic will come in to them. The steamers cannot make serious inroads into the railways' business without a very considerable lowering of rates; a slight reduction will not do it. And if rates are lowered a great deal, the result will be more than a mere diversion of the existing traffic; it will mean a stimulus to industry and commerce which cannot fail to furnish some work for the well nigh universal common carrier, the railroad.

But the growth of new business is problematical and takes time, and in the meanwhile the canal route, will be taking away from the railroads some of the business they already have, just at the time when the revival of the long-and-short haul clause seems threatening to deprive them of their customary freedom in meeting the inroads of competition. At present the boat lines carry something over one tenth of the transcontinental freight tonnage. However, the so-called "transcontinental" traffic includes shipments from as far west as the Mississippi River, and goods destined to inland points throughout the Pacific slope. In fact, only about one ton in five of the westbound transcontinental traffic comes from farther east than Buffalo and Pittsburgh. The Middle West has become dominant over the Atlantic seaboard in the commerce of the Pacific slope.

Now, obviously, it is the traffic from seaport to seaport that is most exposed to water competition, and half of this traffic the boat lines have already taken from the railroads.

In one sense, it would seem as if the railroads had already suffered the greatest damange to which they stand exposed. And yet, even so, there has been no absolute shrinkage of traffic by rail. The increase in the water-borne tonnage has come out of the normal growth of the total volume of business. The question, to which the future holds the answer, is: will the added advantage from the use of the canal be enough to take from the railroads the balance of the coast-to-coast freight, and make serious inroads on the business moving from the interior cities?

Compared to the present rail-and-water routes across the isthmus at Panama and at Tehuantepec, the canal route will, of course, be faster and substantially cheaper. The steamship lines will save an amount which may be roughly estimated not to exceed 13 cents per 100 pounds of freight, or something like one tenth of an average transcontinental freight rate by rail.

This is on the supposition that the boats travel with full cargoes, but the indications are that they will probably find it quite difficult to secure an eastbound tonnage equal to the westbound. It is only the heavy eastward movement of Hawaiian sugar that keeps the tonnage fairly well balanced at the present time. If the freight passing through the canal has to pay expenses on a balance of empty cargo space, the economy of the Panama route will not be quite as great as it appears on paper.

It must be further taken into account that the freight rate is not the only consideration in competition between a railroad and a line of steamboats. The rates are now from 20 per cent to 60 per cent lower by water, and still the railroads keep nearly half of the coast-to-coast tonnage. Obviously, a great deal of the business is governed by other considerations than the mere freight rate. It hardly seems probable that another 10 per cent subtracted would be enough to overcome all these "other considerations" at one blow, and take all the remaining traffic away from the railroads, even if the roads did not meet the cut in rates.

One of the reasons why the railroads can charge more and still keep a large share of traffic is the fact that the trans-isthmian route demands so much handling en route. If a short rail haul is needed at each end, the goods must be loaded and unloaded at least ten times, into and out of three freight cars and two steamers, and all of this means a greater risk of injury to the goods calling for more expensive packing to protect them. With the Canal in use, this disadvantage would be cut approximately in half, though it would still remain a substantial handicap. In the matter of speed the new route will about equal the ordinary slow-freight service of the railways.

There are some things which the steamers can not wholly divert by any reduction in rates. California fruit, and all goods using the special fast freight service of the railroads, would probably continue to move largely as it does now, no matter what inducements the steamship lines might offer. The fruit growers' co-operative associations have enormously increased the value of their crops by following up the shipments on their way eastward, and diverting them by telegraphic orders to the most favorable market. This advantage they will probably not abandon, even if the other obstacles to the carriage of fruit by steamer through the tropics should be successfully overcome. There is doubtless other traffic which will still prefer the overland route, for one special reason or another. On the whole, then, with regard to the strictly coast-to-coast traffic, the situation would seem to be this: that the railroads will not lose all of it in any case; but that they carry less than half of it at present, and would probably come out of a defensive rate war with a still smaller percentage.

Will they lower their rates? If this strictly through traffic were a thing by itself, they would probably make a determined effort to retain it. But it is not a thing by itself. The whole eastern part of the country is given the same rates on transcontinental business, so that the railroads could not lower the New York rates without a similar loss of revenue on the vastly greater volume of shipments originating, or terminating, at inland points as far west as the Mississippi River. This would be a heavy price to pay to keep a small part of the traffic, already carried at far less than the normal margin of earnings. Indeed, this very fact may help to explain why the railroads have avoided rate wars in the immediate past, and have followed a "live and let live" policy toward the steamship lines connecting with the Tehuantepec and the Panama railways. The loss would have been greater than the prize was worth. Unless the steamers begin taking on so much traffic from far inland, as to make serious inroads on this, the main part of the railroads' transcontinental business, we need not expect to see a war of rates inaugurated.

For all of this traffic, especially for traffic which does not reach the seacoast at either end of its journey, the railroads will continue to have advantages that should be almost decisive. They will avoid two transfers, with all the delay and chance of injury involved. They can carry the goods more quickly and more safely than can the steamers with rail connections at the terminals. And when the traffic goes by sea, either the shipper or the steamship company must pay the railroads for their part of the roundabout haul, thus increasing the expense of the ocean route. At present, some shipments move by water from as far west as Buffalo and Pittsburgh, and from points a hundred to a hundred and fifty miles inland on the Pacific slope. The saving from the use of the canal may be equivalent, at a liberal estimate, to an extra haul of three hundred miles at the eastern end of the journey, or less than half as much in the Pacific Coast States, where rates are higher. How formidable this widening of the steamers' sphere of influence will prove, is a matter that can only be conjectured. The railroads may be consoled, especially the eastern lines, by the fact that even such traffic as they may lose is not wholly lost. They will merely have exchanged a long haul at a low margin of profit for shorter hauls at more satisfactory returns, mile for mile. If the general growth of traffic is as great as is expected, the result may be no loss at all, but rather an improvement in the character of the traffic and an increase in ton-mile revenues.

If the railroads are forced to fight for the middle western traffic, they may find themselves somewhat hampered because the present orders of the Interstate Commerce Commission place certain limits on the practice of charging lower rates to Pacific seaports than to intermediate points. This fact should prove to be an interesting incidental problem, but not, necessarily, a terrifying one, even though the Supreme Court has upheld the rulings of the Commission. The idea of these rulings is to grant exemption from the long-and-short haul clause and allow the railroads to discriminate in favor of their terminal cities, just so far as they are compelled by genuine water competition, but no farther. Now that the force of competition by sea is to be considerably increased, it is entirely possible that the details of the Commission's plan may need to be reconsidered and extensive changes made.

In particular, it seems unnatural that Galveston should be classed with Omaha as a place enjoying no water competition, and that New Orleans should be treated as enjoying no more effective water competition than Madison, Wisconsin. Rates from Galveston may not be higher to intermediate points than to the coast, and rates from New Orleans may be only 7 per cent higher, while from Boston, New York, Philadelphia and Baltimore, the intermediate rates may be 25 per cent higher, the through rates being forced down by water competition. At present, no regular steamship lines run from the Gulf ports to the isthmus, but with the opening of the canal we may expect to see genuine and active water competition at these points. Accordingly, we may expect that the Interstate Commerce Commission, following the principle of its first ruling, will grant more liberal dispensations from the long-and-short haul clause, especially to the railroads serving the Gulf ports, provided that these carriers show that they need the revenue which higher rates to intermediate points would furnish.

So far, we have been viewing the more immediate effects of the canal, and we have seen that there will be both gains and losses. Will things bear different aspect in the long run?

Will the railroads ever reach that happy state in which they will not care how much through freight is carried by the steamers? There is good reason for believing that the time will come when railroading will not be a business of "increasing returns" to anything like the same extent that it has been in the past, if at all, and when extra tonnage, carried extra long distances at extra low rates, will not be regarded as a valuable prize, but as a very doubtful asset.

For some roads, indeed, that time seems to have arrived already. To the Pennsylvania Railroad, for example, the regular growth of traffic means the outlay of enormous sums for increased plant to handle the added tonnage, over $64,000,000 having been spent thus in the last year alone. In recent years this company has built what is virtually a separate double-track railroad to handle freight alone and relieve the main line of congestion. The expenses, for various reasons, (not all connected with increased traffic) are growing actually faster than the income. Under such conditions, it is far from true that added traffic always pays, so long as it brings in anything above operating expenses. A road in this condition need not mourn if a competitor kindly relieves it of some of its least profiable business.

The condition of the lines east of Pittsburgh can, in itself, hardly have much bearing on the question at issue, for these lines are comparatively indifferent to canal competition in any case. But we are looking into the future, to a time when lines farther west will be approaching a similar condition. At present, it is the western roads, rather than their eastern connections which are chiefly responsible for the disregard of distance that characterizes our transcontinental freight rates.

When the plant was partly idle, more tonnage was a boon at almost any price. But as traffic becomes more dense, the motive to discriminate becomes weaker and weaker. Thus the western lines made low rates to fill their eastbound empty cars with lumber, with the final result that the policy was too successful. The cars were more than filled, and further shipments of lumber were chargeable with the cost of added rolling stock, and the haul of empty cars westward, as well. This is an extreme case, but typical.

The western roads have, of late, been spending many millions in enlarging the capacity of roadbed and rolling stock, while the moving of freight through Chicago, St. Louis, and other western cities is a great and growing problem, calling for huge capital expenditures. No traffic is self-supporting which does not contribute its full share toward the interest on these outlays. When congestion turns railroading into a business of diminishing returns, the traffic that was once eagerly sought for at extra low rates, may become an actual burden, to be borne grudgingly, and only out of consideration for the many interests that are always dependent on an established adjustment of charges.

Across the arid and mountainous stetches of the West the tonnage will hardly grow to this extent, and the officials in charge of these divisions may never cease to cast covetous eyes at the water-borne traffic. But as the rest of the country grows up to its transportation facilities, we may expect that the carriers in general will soon cease to lament the business the canal has taken away, while they will continue to enjoy the more attractive buisness which the many-sided growth of the country will bring with it.

Let us suppose that the canal has taken its place in our commercial system and our growing population and industry have adjusted themselves to it. The railroads will then, as now, be facing the problem of providing billions of capital to meet the transportation demands of our ever-growing country. What would they say then to a proposal to close the Panama waterway to all coastwise traffic, and throw upon them the responsibility of raising funds to provide facilities for a sudden increase of relatively low grade business? One can hardly imagine them actively advocating the passage of such a measure. On the contrary, if, in the year 1950, an earthquake should destroy the canal, it is quite possible that among those who would view the catastrophe with the most sincere grief would be the heads of the great railroad systems of the country.

The Mechanical Side of Railroading

NOTE: The following address was delivered on November 19th by William Schlafge, general mechanical superintendent of the Erie Railroad, before the Railroad Men's Improvement Society of New York City.

ABOUT one hundred years ago the progress of the world in all lines of effort brought about a condition where commerce, particularly inland commerce, had outgrown the known and tried means of transportation to such an extent, that an arrest of development was imminent, unless new and adequate methods could be devised to meet the changed conditions of the times.

Then both in the old world, and in the new, the channels of commercial carriage were the waterways, natural and artificial, and the highways. The latter varied from crude, primitive pathways, through the newer and sparsely settled regions, and of severely limited unit load capacity, to the scientifically constructed roads, of the older and more populous communities, which, designed with that end in view, were correspondingly more economical and efficient.

Steam was receiving recognition as a practical aid to navigation and the day when its perfected application would supplant sailing power, was in sight to wide awake observers. But on the land, domestic animals were still the main reliance as prime movers. It was in land carriage where the insufficiency of means was most keenly felt, and which called the loudest for relief. But in spite of the efforts of hopeful dreamers and hard working men of mechanical genius and of dauntless courage, to adapt steam to the purpose, the day seemed yet far distant when relief would come by that means. As usual history repeated itself, just as it does to-day, and about everybody scouted the idea as an impossibility and an idle dream.

But in every crisis, in every age, some commanding figure rises above his fellows and quietly, calmly takes the burden and meets the problem of the hour. This is remarked with such unfailing regularity throughout history that we have come to speak of the advent of such men as Providential.

Is there a new continent to be discovered? a Columbus appears. Are the liberties of a nation to be defended and preserved? a Prince of Orange or a Lincoln arises to guide its destinies. A Goethals is found to meet the supreme test of mighty constructive achievement and overcomes all obstacles, even the seemingly unconquerable forces of nature; and so, in the early part of the nineteenth century, the master mind of Stephenson harmonized and co-ordinated the diverse theories and accomplishments of his contemporary investigators, and gave to the world the steam locomotive as a practical agency of commerce. Nor does it detract from his just fame, to concede that another may have a better claim to be considered as the original inventor of the steam locomotive. It is fairly well settled that he made the earliest application, of known principles, which produced a workable, successful locomotive of commercial utility. A mere passive academic knowledge of principles, or of truth, is of no avail unless applied. It is application to useful ends that counts.

Thus we see that railroads had their beginning in the fruits of mechanical genius and, after the passing of the century, that separates these pioneer efforts in locomotive design and building from the worthy accomplishments of to-day, we may still say that the mechanical side of railroading has retained its absorbing interest and its original relative importance.

The history of the development and progress of railroading may be pictured graphically in many ways; but it may be doubted if that wonderful story can be told more vividly, more convincingly, more accurately than by contemplating the evolution of the locomotive from Stephenson's "Rocket" to the latest Pacific type or triplex compound or, indeed, by tracing the growth of carrying vehicles from a unit, scarcely larger than an ordinary road wagon, to the seventy-five-ton freight car.

If we are to analyze railroad operation it is obvious that we will find that each department has problems and troubles peculiar to itself. On the mechanical side the great problem, as to American railroads, is the care, inspection and maintenance of 2,500,000 freight cars, 56,000 passenger train cars and 66,000 locomotives representing an investment estimated at three billion three hundred and fifty million dollars and calling for an annual maintenance charge estimated at $450,000,000. It might be remarked, in passing, that the latter sum would more than provide each year for a work of peace equal to the Panama Canal; but it would only finance the European war for about ten days.

Were all the cars and locomotives of American railroads coupled together, over two thousand miles of track would be required to hold them. They would considerably more than fill solid the main line double tracks of the Erie Railroad, from New York to Chicago or, on a single track, they would reach from New York to Denver.

It is not possible, nor even desirable, perhaps, to go into the details of mechanical operation to show the magnitude of the work involved; but a faint conception of it can be had by recalling that approximately one billion passengers and over one billion tons of revenue freight are carried per annum on American railroads. Carrying units must be kept in condition to transport this great volume of business in safety, to conserve both life and property, and locomotives must be maintained in condition to move it. The extent of this work to some degree is indicated by citing, as an example, a few essential parts of a freight car which if in disrepair, may cause trouble ranging from an interruption of traffic, more or less serious, to derailment and loss of life or property.

Such parts are wheels, axles, journal bearings, brake beams, air hose and drawbars, of which there are twenty-eight items per car unit, or a total of seventy million important parts, on the entire freight equipment of the country, that must be watched every day to prevent disaster.

In addition to these principal parts, having to do with safe movement of the car itself, there are innumerable parts of lesser importance which, if defective, may endanger the safety of the car and many others such as defective roofs, sheathing, floors and doors, projecting bolts and nails, which may cause damage to property entrusted to transportation.

Aside from the multitude of things which self interest and ordinary prudence would cause the carriers to look out for, there are many duties of inspection and maintenance, imposed by the laws of the several States and of the United States, referred to collectively as safety appliance laws. These add to the burden and expense of mechanical operation. There are literally hundreds of parts on every car, a failure or absence of which, may cost the operating carrier a fine of one hundred dollars. There are a like number on every locomotive, which require the closest attention, to avoid trouble leading either to a fine or the compulsory withdrawal of the locomotive from service.

To meet the complex responsibilities of the mechanical side of railroad operation, and maintain the equipment in a state of preparedness demands, as in every other department of the business, a balanced and efficient organization, whose members shall be devoted to the work and sustained by the animated pursuit of a common purpose.

The usual staff organization of the mechanical department consists of a chief officer, styled superintendent or general superintendent of motive power, mechanical or general mechanical superintendent, superintendent of machinery, or other title, appropriate to the office. On the larger roads the chief mechanical officer, as a rule, is assisted by one or more deputies, bearing various titles, who have general authority and, sometimes, have direct supervision of the shops, thus standing between the shop organizations and the chief of the department. Not infrequently there is an officer charged with responsibility for the work of the car department, with the title of superintendent of car department, or master car builder. On the Erie Railroad there are three mechanical superintendents. One has general charge of all car work of the system. One is assigned to each grand division of the road, in direct charge of the locomotive shops and has concurrent jurisdiction, in a restricted sense, over car work in his territory. The other regular staff officers are a mechanical engineer, electrical engineer, engineer of tests, chemist, chief boiler inspector and general inspectors of various grades and diverse duties. The larger roads add to the above two general officers who are absolutely indispensible where there is any pretense of practicing the higher phases of railroad economy, using that term in its scientific sense. There are an efficiency engineer who is in charge of shop costs and production, and frequently at the head of the piece work system, and an expert in locomotive economy, whose duty it is, to save fuel and look after the economical operation of the locomotive. On the Erie Railroad these officers are designated, respectively, as superintendent of piece work and apprentices and superintendent of locomotive operation.

The chief officer of the shop organization is the division master mechanic, or shop superintendent, on the locomotive side and a shop superintendent, foreman of car repairs, or an officer having some other suitable title, at the car shops. The division master mechanic frequently has charge of all mechanical work on his division; but it is customary to have large car shops entirely independent of his authority.

The shop organization varies with the size of and importance of the shop. At a large shop there are usually a general foreman, an assistant to the general foreman who is in charge of shop costs and production, departmental foreman, inspectors, etc.

In the division mechanical organization special mention should be made of the engine terminal which, by reason of its functions, is not properly classified with shop operations, whether closely associated with them or not. The engine terminal is to railroads what the coaling station is to ships on the high seas. Nothing will paralyze traffic movement and demoralize operation quite as effectively as putting an engine terminal out of business, or to have it in charge of a man who is incapable of facing all emergencies, and overcoming everything, but the physically impossible. This is so well understood that we are accustomed to say, that engine house foremen like poets are "born not made."

Associated with the divisional organization are the road foremen of engines and the inspectors of locomotive service, called supervisors of locomotive operation on the Erie. The mechanical department has concurrent jurisdiction with the transportation department over these officials.

It has been shown that a strong organization is essential to good operation; but there are limits to what may be done by the best organization and the most devoted and diligent application, on the part of the personnel. This brings us to the consideration of shop and engine house facilities. A good organization may overcome, in a measure, the handicap of inferior, inadequate or obsolete facilities, but it can never supply their lack.

The change from wood to steel in car building calls for new facilities, adapted to repair steel cars; the increase in the size, and complexity, of the locomotive unit calls for larger roundhouses, improved engine terminal facilities, and for heavier and more improved machinery and appliances to handle and repair them. The needed facilities are scarcely installed when an insistent demand is made for their improvement, so rapid are the changes that make achievements of to-day, but stepping stones, for the greater achievements of to-morrow.

But the mechanical side of railroading produces no income, it sends no actual cash into the treasury regardless of what it may keep from going out. Its mission is to do its part to keep the instrumentalities of commerce in shape to earn revenue. Each passenger locomotive may earn approximately $3,700 and each freight locomotive $52,000 per annum, but the sad truth ever confronts the mechanical man, that from twenty to twenty-five per cent of all operating expenses is laid up against him. He is a good spender and he is always "broke." His stories, therefore, are apt to be of the hard luck variety, and they are received with the same cordial enthusiasm that a subscription paper, to buy the Kaiser a loving cup, would be received in London or, as the solicitation of a similar token of affection for King George would be received in Berlin.

The mechanical man makes up a modest program for a new roundhouse at one point; two or three modern coal and ash handling plants; a couple of new power plants; perhaps a new shop; a hundred new machines and a job lot of fifty thousand dollars' worth of small tools and miscellaneous things regarded as useful in his business. When the hard pressed management makes a few minor revisions of his plans he cheerfully accepts the allowance, builds an extension to several stalls of the old roundhouse to house the big engines, puts new flues in the boilers of the much slandered power plants, gives the old shop a coat of whitewash inside, forgets the rest and, like a true railroad man, settles down to do business with what he has, as better men have done before him and will do after he has gone. After all, he reasons, there is something to be thankful for. If something had to be cut off, far better the improvements than his head. Then, if he is somewhat of a philosopher and given to rather fanciful speculation, he may occasionally dream, and even pray, that a certain high administrative body at Washington may get religion, because when men get religion, the hereafter is illuminated with a brightness never before realized and they hasten to make reparation for the wrongs and misdeeds done in their days of evil. He well knows that complete reparation would cause the improvements he recommended to appear in a different light, and might even make possible those bridges, the maintenance of way people have been after so long, and the ties and rails needed so badly.

"New occasions teach new duties; Time
  Makes ancient good uncouth;
They must upward still and onward, who
  Would keep abreast of truth."

Much ancient good has been found to be uncouth in railroading, within recent years and, sad to relate, much has been discovered to be very uncouth that never was any good.

One ancient good, that has given way to enlightenment, is the old railroad apprentice system. In the old days, the average apprentice who served his time in a railroad shop, learned to operate the various machines and to repair locomotives, but he was rarely an all around mechanic. Little, if any, attention was given to his educational qualifications when he was apprenticed and, unless he had the ambition to attend night school or apply himself to self study, he usually lacked that knowledge of the principles of mechanics and of higher mathematics, which would fit him to extend his field of usefulness. Also the master was not particular, at all times, to concern himself about giving the novice the best opportunity to become a good all around journeyman. If the apprentice had special aptitude for certain work he was too frequently kept at it, instead of moving him about to afford a wider range or training.

Also certain details, like valve setting, air pump, lubricator, injector and tool room work were regarded somewhat in the light of trade secrets and the apprentice was fortunate who got any experience or knowledge of this work.

These unfruitful conditions were well known, but finally progressive thinkers came to the realization that the system was all wrong and that it was not beneficial to the master, the apprentice or to society, and out of these conclusions has grown a system of railroad apprenticeship and industrial education of the highest type.

Speaking of the apprentice course of the Erie Railroad as typical, I can say that the railroad apprentice to-day has every advantage to become a well-rounded mechanic, and is given a basic technical education that equips him for the widest usefulness. In most cases the instructors are college graduates and are far better equipped to teach industrial education than many employed for that purpose, in high schools, trade schools and other places, where that branch is taught.

Contrary to the practice under the old system, the apprentice is now carefully and fully instructed in the very things that, formerly, were withheld from him, and extreme care is taken to make him proficient in every detail of the art. Not only is the course free but the apprentice is paid for his time while under instruction. The results have been most gratifying.

Just now interest centers in the achievement of the Meadville School, in building a miniature locomotive. This machine is an exact reproduction, to scale of a K-I Pacific type locomotive and you are all cordially invited to inspect it at the Erie ticket office, 399 Broadway, where it will soon be placed on exhibition. The locomotive was laid out, built and finished complete by the apprentices and we point to it, with great satisfaction, as a justification of the modern ideas of industrial education as applied to railroad work.

Railroad work, beyond question, is very interesting. It is frequently remarked, that there is something about the life which attracts and holds men, with greater force, than its material rewards. If we seek far enough the reason will be found in that lofty, and exacting attribute, of human nature which withholds contentment and satisfaction from the normal man unless he can feel himself a part of the world's real work. It is not ambition, for ambition is not always worthy, and sometimes is even sordid and mean. It is rather that vital and deathless something of soul life, deep rooted in character, that gives off only inspiration and courage. It is that same force that sustains and disciplines real men to find their chief reward in work well done, and in efforts well directed to ends worth while.

Railroad work surely has a high place in the activities, which most benefit mankind, and it is not strange that men should find the field attractive. Recalling our subject for this evening, it is believed that the mechanical side of railroading is, at least, as interesting, as attractive and as fascinating as any other branch of the service.

But I would not have you get the impression that I am speaking as a mechanical man. Rather would I have you think of me as a railroad man. I have scant tolerance for departmental distinctions. Departmental lines are very proper, and necessary, to fix the lines of responsibility and for the orderly and effective conduct of business; but no further. It is trite to say that all energies, that are not directed toward the ultimate and legitimate ends of any business, are wasted or at least impaired. That end in the railroad business is to sell transportation at a decent profit, and everything which diverts energy, that the business is taxed to create, from that object is a thing to be weeded out. This thought may be illustrated by picturing a wide stream in whose course, at a certain point, it must pass through a long narrow gorge. On the upstream side the waters are collected, by various tributaries, from hundreds of square miles of drainage area. The stream gains in volume until, at the narrows, the waters pile up and develop a tremendous, concentrated energy of well nigh resistless force, capable of being transmuted to the untold benefit of mankind. On the down stream side the waters spread out again into a wide, placid and, perhaps, sluggish stream as if tired by their demonstrations of energy passing through the gorge. The one shows the cumulative effect of the concentration of energy; the other of its dissipation.

Those who accustom themselves to see departmental work in capital letters, failing to co-ordinate their relations with the general interests of the business, are in danger of acquiring a perspective like that of the fly in the fable. You will recall that a fly who had perched himself on the axle of a chariot become much puffed up by what he fondly believed to be his ability to raise so much dust. In how much more kindly esteem would history regard this fly had he been willing to share his dust-raising glory with the chariot wheels and the horses. The fly was afflicted with a distorted point of view. Also he lacked generosity and a sense of humor.

We all preach about co-operation but constructive evidence of its practice does not equal the noise we make about it. The word co-operation, like efficiency and other mouth-filling terms, is rattled about the country like a pebble in a tin can. Many know what constructive team work is, a few practice it, but the majority merely talk about it, and look wise.

In 1878 there was widespread discussion about the resumption of specie payments. Much speculation was indulged as to whether it could, or could not, be done, and many predictions were made of the dire calamities that would follow an attempt to do it. John Sherman said it could be done and he quietly, and simply, announced that on a certain date the Government would pay its obligations in gold. That settled the matter. The same decisive action is all that is needed to effect real co-operation, and co-ordination of purposes, in railroad work, and, as Sidney Smith said, apropos of the proposition to build a wooden walk around St. Pauls, "If we lay our heads together the thing is done."

As a parting thought, following much that I fear has been tedious rather than instructive or entertaining, let me urge that a worthy ambition, diligence and industry are the price of success and the field is open. Success is a relative term and when one achieves a goal, approaching the ultimate limits of his capabilities, he has done well notwithstanding that he may not fill the world with his fame or receive its applause. In the words of one of the greatest thinkers of all time:

"He that seeketh to be eminent among stable man hath a great task, but that is ever good for the public, but he that plots to be only only figure among ciphers is the decay of a whole age."

Operation

Safety Record of the Chicago and North Western.

THE Chicago and North Western's safety record for the fiscal year ending June 30, 1914, shows 33,000,000 passengers carried over its lines without a single fatality to a passenger. Furthermore, this remarkable achievement was accompanied by an increase in the number of travelers carried as compared with the year before of nearly a million. The total mileage traveled by passenger trains during the year was 21,537,781 miles.

The management believes that this record is proof positive of the success of the policy on which the Company has been working which is to provide the best of everything including all safety precautions and devices. It makes a special effort to maintain a regular, convenient, comfortable and even luxurious service and in addition, maintains its track, stations and equipment to the highest standards and is constantly installing the most improved type of signals. In other words, the greater safety movement in all its ramifications is thoroughly practiced in the operation of the North Western's trains, as is indicated by the splendid results for the past fiscal year.

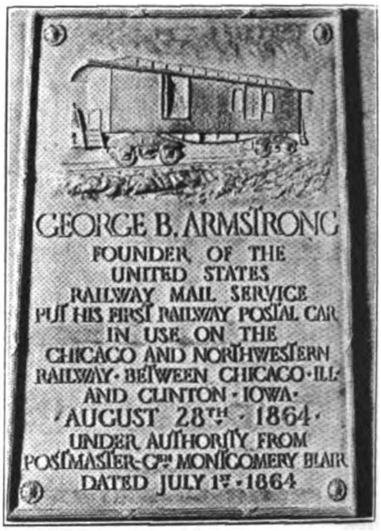
Bronze Reproduction of First Mail Car.

TO commemorate the historical fact of running the first postal car on its lines and also to keep fresh in the minds of the public the help and encouragement given to Mr. George B. Armstrong in founding the United States Railway Mail Service, the Chicago & North Western Railway Company has placed in its new Chicago terminal station a handsome bronze tablet showing this car and giving the date of the first trip of the first railway post office car run in the United States.

This tablet shows one of two full railway post office cars built in the United States, built in May, 1867, by the Chicago & North Western Railway Company after plans prepared by Mr. George B. Armstrong, founder of the railway mail service.

These cars were run from Chicago to Fort Howard, Wisconsin and from Boone to Council Bluffs, Iowa. The first railway post office car operated in the United States was run between Chicago and Clinton, Iowa, on the 28th day of August, 1864. That car formed the basis of the present railway mail service. The Chicago & North Western Railway was the only railway corporation in the country that gave any encouragement to Mr. Armstrong in his efforts to secure postal reform and greater celerity and security in the transmission of the mails, and gave him the material help necessary to carry out his plans.

The first trip was a great success and demonstrated the enormous value of the new railway post office to the business interests of the country.



Bronze Reproduction of First Mail Car, Which Has Recently Been Placed in the New Chicago Terminal of the Chicago North Western Railway.

Track Inspection on the Southern Pacific.

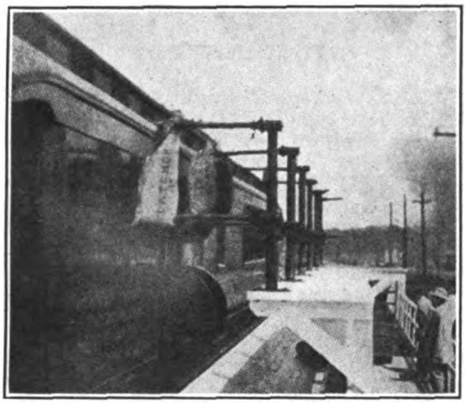
TWO million and a half miles are covered each year by the track walkers who patrol the right of way of the Southern Pacific Company. Each day every one of the seven thousand miles is gone over piecemeal. Roadbed, tracks, switches, bridges and trestles, culverts, signals, everything, is carefully scrutinized that trains may move along quickly and with safety. On straight tracks, where there is no danger of being struck by trains, the track walker rides on a velocipede. Where there are many curves or train service is frequent, he walks on foot.

The inspector is equipped with red flags, lanterns, fuses, torpedoes, spike-mauls, track wrenches and extra bolts, so that he can take care of whatever emergency situation may arise. The automatic block signal, by the position of its blade, will show any interruption in the continuity of the rails; and the work of the track walker is an added safety precaution.

Chicago and Alton Adopts Automatic Mail Exchange System.

THE Chicago and Alton has contracted with the Hupp Automatic Mail Exchange Company of Chicago for the installation of its mail exchange system on mail cars and thirty-three mail exchange stations between Chicago and St. Louis. The advantage of the Hupp System is that an almost unlimited number of bags can be exchanged while by the old system, only one bag per station was permitted. Another advantage is that the Hupp System is automatic, the mechanism performing the work being driven from a worm attached to the middle of one of the axles of the mail car. This mechanism is thrown into gear by means of a trip located outside of the rail of the roadway, just 390 feet from the exchange station.

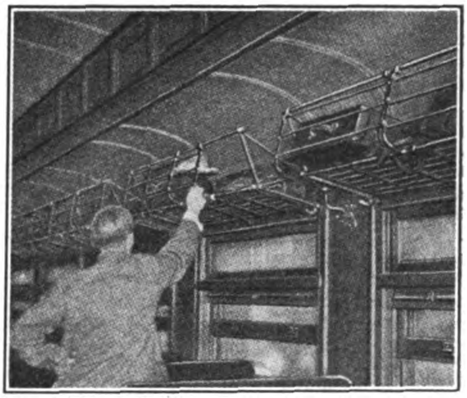
When the machinery is set in motion the car door begins to open and continues opening while the train covers a distance of 180 feet. The next step is the opening of the receiving arms, which are attached to the side of the car. They open at the forward end in the manner of a gate, and become fully extended as the train travels another 180 feet. At the same time the delivery chute is automatically moved out of the door and by the time it reaches the station receiving trough, as shown in the illustration, the bottom of the delivery chute is at an angle of 45 degrees, and the mail bags slide from the car by their own weight. The mechanism then brings the chute back inside of the car, closes in the receiving arms and closes the door. By the time the train has traversed the third 180 feet these arms have been returned to their original position at the side of the car. It is necessary for the car, however, to travel several hundred feet more before the cam wheel completes its revolution and is automatically locked out of action. The receiving arms start to extend outward about 30 feet before the delivery chute starts out of the car, but the delivery chute returns before the receiving arms are folded. It takes 1,080 feet for the mechanism to perform a full cycle, but it is so arranged that the car passes only 780 feet from the time the door begins to open until it is entirely closed.



AUTOMATIC MAIL EXCHANGE SYSTEM WHICH PERMITS THE EXCHANGE OF AS MANY AS TWELVE BAGS AT ONE TIME.

The New Safety Baggage Rack of the Atchison, Topeka and Santa Fe.

THE Atchison, Topeka & Santa Fe has placed in service on some of its through passenger train cars a new type of baggage rack designed by the engineer of car construction. These racks were designed to provide ample storage capacity. They are provided with gates which slide on the frame of the rack and serve to keep the bags, parcels, wraps, or whatever may be placed in the rack, in place. The illustration shows the racks installed in one of the day coaches recently built by the Santa Fe, and also shows the way in which the gates are operated by the passengers. There are two gates to each rack, so arranged that each may be operated independently of the other.



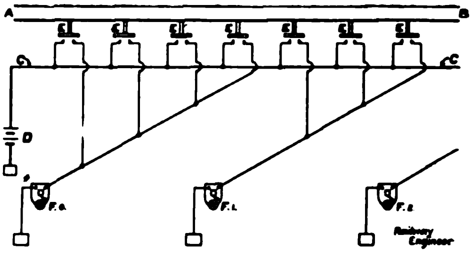
NEW SAFETY RACK WHICH ELIMINATES THE DANGER OF BAGGAGE FALLING UPON PASSENGERS.

The racks are of special advantage, especially on through trains where a considerable amount of hand baggage is often carried by the passengers, in that they will hold more than the ordinary rack now used, and at the same time prevent the luggage from falling on the heads of the passengers. In this way it eliminates damage claims from these causes and provides sufficient capacity to hold all the baggage of the passengers, thus keeping the aisles free from obstruction. The construction is so substantial that the gates will slide easily when the rack is loaded to its full capacity.

An English Warning Signal for Railways.

M. B. COOPER, of London, England, has invented a safety warning signal for railways which has for its object, the elimination of risks of engineers and firemen mistaking, or not seeing signals, and, so far as England is concerned, has the additional advantage of doing away with the use of extra signals during foggy weather.

The system works as follows:—Along the rail A. B. an electric wire C. is placed, which conveys positive electricity from the battery D. or from an electric generating station connected with contacts E., which are placed in such a position that the weight of the train on the rail A. B. would act upon the contacts E. and form a circuit. At given distances would be placed electric bells F. on, for instance, the "up"



Safety Warning Signals for Railways.

line, and horns or other suitable instruments on the "down" line. These bells F. would be so placed that any train would make contact and make a circuit, and so set the alarm bells ringing two miles more or less behind the train. In a similar manner the alarm bells may be set ringing two miles more or less in front of the train. The electric bells F0, F1, F2, are placed on the side of the track one mile more or less apart.

For example: The train which is called X starts from the terminus and makes contact all the time as far as the two mile bell F2, these contacts connected with F1 continually ring the bell F0 at the terminus. When X has passed the two mile bell, the terminus bell ceases to ring. When X has passed the two mile bell and is making towards the third mile bell, the first mile bell F1 starts ringing until X has passed the third mile bell F3. When X has passed the third mile bell and is making towards the fourth mile bell the second mile bell starts ringing until X has passed the fourth mile bell, and so on.

Another train which is called Y leaves the terminus on the same track must evidently leave after the terminus bell F0. has ceased ringing, i. e., the train X has already passed the first two mile bell F2.

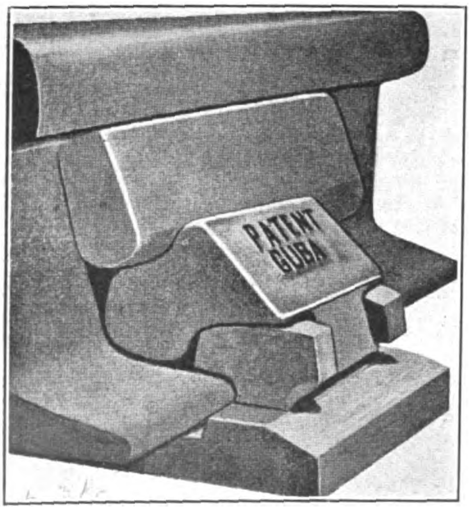
Suppose Y reaches the first two mile bell, if same is not ringing, then it is evident that the line is clear for two miles ahead, viz., the third mile bell. Y reaches the third mile bell and finds that this bell is ringing; this means that X has broken down or stopped for other reasons, and therefore Y must stop until the third mile bell ceases to ring, thus avoiding any possible chance of collision.

Mechanical

A New Foreign Rail Fastening.

THE accompanying illustration shows a rail fastening invented and recently patented, by a citizen of Hungary. As indicated, it consists of a block which fits over and bears upon the head (or heads) of the dog spikes, screws or bolts used to secure the rails to the sleepers. The top of the block is hollowed out to form a seat for a taper steel key, which is driven between this seat and the underside of the head of the rail. The lower block sometimes has lips to embrace the sleeper or sole-plate.

This fastening has been laid on the Roumanian and Hungarian State Railways, the Swiss Federal Railways, the Aussig Teplitz and several other railways on the Continent. It gives great support to the head of the rail, and is said to entirely prevent lateral displacement and creeping. It also prevents the spikes working loose and no "hammering" takes place. The keys are marked with an arrow and are always driven in the direction of the creep.



NEW EUROPEAN RAIL FASTENER WITH NOVEL FEATURES.

Frictionless Rails.

THE New England Railway Club listened to a most comprehensive talk at its November meeting on "Typical Rail Failures," by Mr. F. A. Weymouth, engineer of tests of the Maryland Steel Company. Mr. Weymouth took into consideration practically every known rail failure and its cause and by means of illustrations so clearly presented the subject to his audience that his address was considered one of the most informative and important ever delivered before the New England Railway Club.

It would be impossible to produce within the limits of the "Railway World" even a satisfying abstract of this most important paper, but it is suggested that to all those interested in the matter of rail failures and the development of a rail in which these failures may be overcome, should procure a copy of the Club's proceedings for that month.

Mr. Weymouth in his closing remarks referred to a frictionless rail on which a group of engineers have taken out basic patents and which is the result of a very careful study of operating conditions and rail wear on curves. To quote from Mr. Weymouth's remarks:

"Having in mind the action of the wheels in passing around a curve, as noted above, it was observed that the line of contact on the low rails was greater, and, in many cases, the weight also was greater on the low rail than on the high rails. This necessitates that the slipping must be confined to the high rails and since the slipping is periodical and only occurs just enough to adjust the truck to the radius of the curve at intervals, the wheel on the high side of the curve is constantly impinging against the high rail. It is readily seen that if we can concentrate all of our slipping on the low rail the truck will readily adjust itself to the radius of the curve, and we will thus check the impinging action against the high rail.

"To accomplish this, the Frictionless Rail Company recommend the use of a rail with a much narrower head on the low side of the curve. This reduces the line of contact and concentrates the slipping to the low rail."

At the conclusion of Mr. Weymouth's paper, Mr. T. F. Dwyer, Jr., took up the discussion of

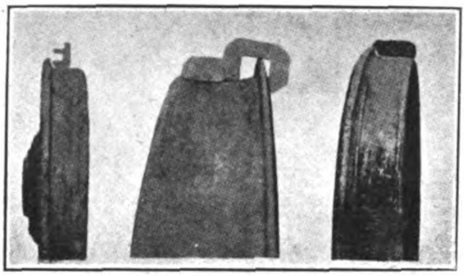


FIG. B.

the Frictionless Rail and presented a half dozen lantern slides showing conditions of wear and sections of this rail which are offered to overcome some of these conditions. We present herewith the figures and photographs employed by Mr. Dwyer to illustrate his remarks.

Figure A shows wear on the high rail and low rails of a curve, respectively. Contour of the rails when they were removed from track is indicated by the dotted lines. It is our opinion that a great part of the side wear on the high rail is due to the broadening of the head of the low rail when it flows over. This wide head on the low side offers resistance to lateral slip of the wheels after the outer wheel flanges have struck the high rail.

Figure B illustrates conditions of wheel wear which are more or less common. The flange is the important indication of wear. The wheel at the left has a well defined right-angled flange; the middle one has a remarkably sharp flange, and the one on the right has a more or less apparent false flange at the right side of the tread. With rail wear decreased on curves through the agency of a rail which lessens the friction, it is self evident that wheel flanges are not going to suffer such punishment as they do now.

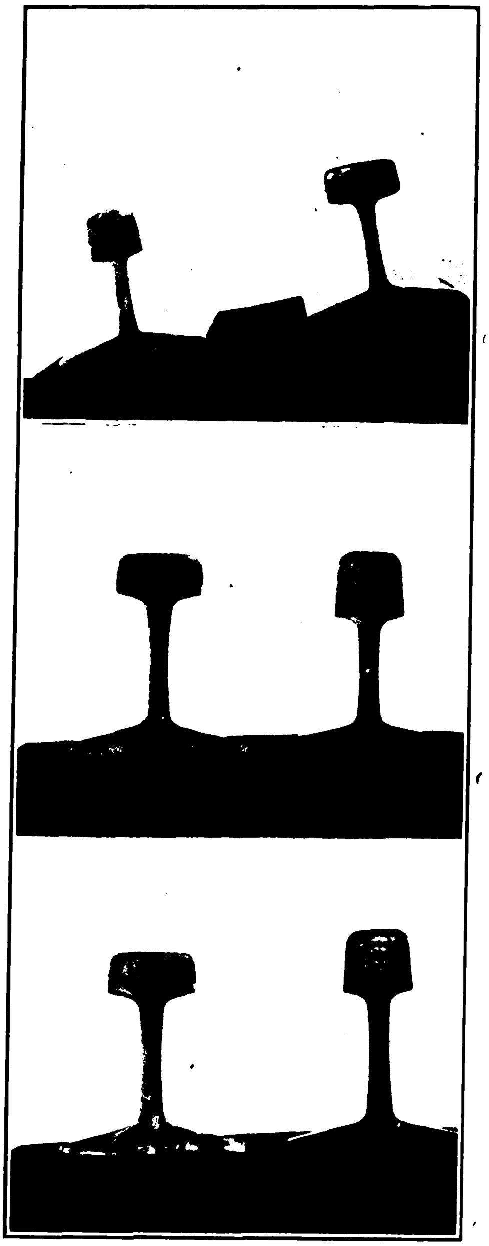
Figure C shows a Frictionless Rail with the standard rail to which it is companion. The standard rail is an 85-pound A S C E section. Frictionless Rail is used as the low rail on curves with the standard rail as the high rail. This simple construction reduces the ordinary pressure against the high rail which results in side wear, widening of gauge and increased resistance to trains passing through curves.

Figure D illustrates a Frictionless Rail companion to 90-pound A R A Type A section. This Frictionless Rail is being used by about seven western roads with good results. Its height is the same as the standard rail, its fishing space is less, but of such dimensions as to accommodate a bar which fits the 90-pound A R A Type B rail, and below the head, the web and base are the same as the standard rail.

Figure E shows another Frictionless Rail companion to the 90-pound A R A Type A section. This Frictionless Rail is being used by the Southern Pacific lines and several other roads. It is a bit higher than the standard rail, so that it may have the same fishing space as the standard rail and accommodate the same angle bar.

Figure F is a view of a sharp curve laid with Frictionless Rail. Most of you will recognize it as the east end of the "Y" at Waltham on the Boston and Maine Railroad. Frictionless Rail has been on this curve as the low rail for nearly a year. The rail wear in this length of time has been very slight. The track has remained to gauge, and there has been little or no maintenance on the curve. This curve is 16 degrees 30 minutes in curvature, so that the rail is getting some service here.

Figure G is a view of the Belmont curve on the Boston and Maine Railroad. Traffic is heavy over this curve, and there are all kinds of trains at all speeds. This curve rides noticeably better since Frictionless Rail was laid last November. A railroad man whom we brought out to see the curve lately found an interesting bit of evidence that the rail wear was slight and that the lateral thrust against the high rail was re-



FIGS. C, D, AND E.

duced. On the gauge side of the high rail, he found a slight lip of metal which was sure evidence that no cutting has been going on.

Frictionless Rail is a patented construction which was designed primarily to eliminate excessive wear of the high rail on curves. It does this by reducing the side thrust against the high rail, through its allowance of lateral slip. I think we have demonstrated on all our curves that we do this. And the only conclusive way to be sure of the rail is to see it in track.

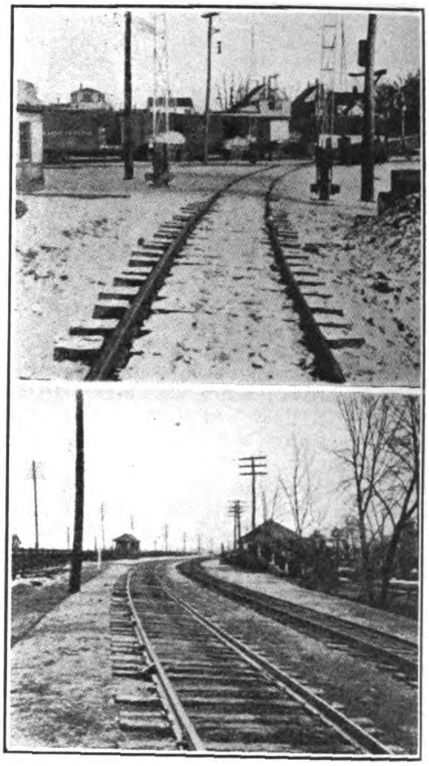
The design of Frictionless Rail has proven to be a desirable section. It rolls very well and its contour remains perfect in track. The point that Mr. Weymouth made with his slide showing a false flange riding on the low rail, is interesting in connection with Frictionless Rail. It is so narrow that false flanges do not ride on it. There is very little flow of metal, and the load is carried in the center of the rail over the web.

The real function of the rail is to reduce side wear of the high rail. This is one step only in the solution of rail problems, but it carries interesting conclusions. Your track on curves remains to gauge better, your ties receive less punishment, and trains pass through the curve with greater ease. You save your wheel flanges because you get around the curves more easily, and you save the rest of your equipment, such as journals, trucks, etc., as a result. We feel that a large part of the energy which was formerly devoted to destruction is now devoted to traction.

We have a series of sharp curves which are laid with Frictionless Rail on a certain railroad ranging from four degrees to twelve degrees. Frictionless Rail has been laid here about two months. After it had been down a month, we received word that certain classes of power were hauling from eleven to fourteen per cent more freight over these curves than they had ever been able to haul before Frictionless Rail was laid. These figures are higher than we hoped for, but are actual and were compiled in ordinary service.

We have a couple of curves in the South Station yards—the inbound tracks of the Boston & Albany and the New Haven. The interesting point on these curves is the fact that long, heavy trains that receive a stop signal on the curve, are able to start without additional help from a switching engine. I believe that there were formerly reports once or twice a week that trains stalled there. In the four or five months that Frictionless Rail has been in service at this place, there have been just two such reports. One report was on an eight-car train that could not get through alone; on investigation, it was found that the brakes had become set on two of the cars. We have had no explanation of the second yet.

Another point about Frictionless Rail curves is that they ride more easily than ordinary curves. A friend of ours who is quite familiar with Frictionless Rail was riding over a road in Pennsylvania about a month ago. He knew that this road had Frictionless Rail on a number of their curves, but hadn't seen it. Finally, riding through a certain curve, he thought he recognized the gliding motion, hurried to the rear of the car and found that he was riding over the rail. We consider that good testimony on the riding qualities of the rail.



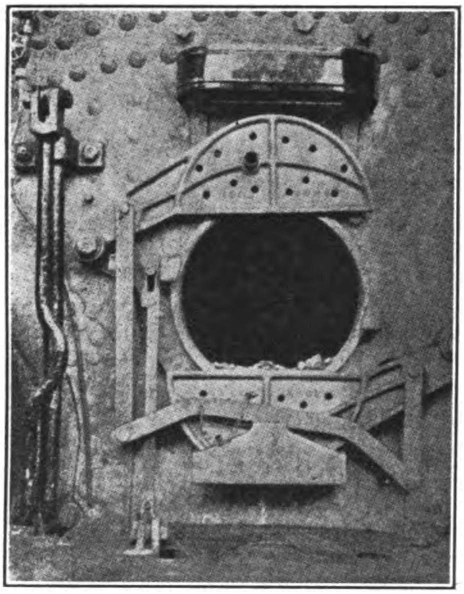
Figs. F. and G.

At the present time we have tonnages of Frictionless Rail on about twenty representative roads all over the country. The reports are uniformly good and grow better as the length of service of the rail grows. The absence of actual complaints or criticisms is truly remarkable considering the development of a device which is so effective, but revolutionary.

The point I wish to emphasize on Frictionless Rail is that the rail is purely a design. The track construction with standard rail on the high side of a curve and Frictionless Rail on the low side, is the thing that does the work. We do not attempt to specify chemical composition of the metal or methods of manufacture. That is in far better hands than ours. The railroad buys the rail from the manufacturer and deals with the manufacturer just as with ordinary rail. Of course we are interested in getting as good metal in Frictionless Rail as the railroad is willing to buy; manganese rail would probably allow you to forget your curves entirely. If Frictionless Rail solves some of your troubles on curves and relieves certain strains, I think that you can consider it just one step in the solution of rail problems.

A Locomotive Gravity Fire Door.

P. C. WITHROW, mechanical engineer of the Denver and Rio Grande, has developed and patented a foot operated locomotive fire door, the two halves of which are so arranged as to counterbalance each other, which has been experimentally in use on the Denver and Rio



A Gravity Fire Door Developed and Patented by a Mechanical Officer of the Denver and Rio Grande.

Grande for about two years and has met with considerable favor.

The door is in two sections, the upper part being pivoted at the left and the lower part at the right. The foot lever employed to open it is located at the left and twenty inches out from the back head. This lever operates the door opening cam which has a specially formed shoe at its upper end bearing against the under side of the upper door. The mechanical arrangement gives a comparatively large leverage by means of which to start the door without unnecessary effort, and the decreasing effort as the movement progresses, keeps the travel of the foot pedal within reasonable limits. The upper door has sufficient overbalance to insure prompt closing on releasing the pressure from the foot lever. As the closing movement proceeds, the various points return to a normal position, thus destroying the overbalance, and the closing is completed without slamming. The foot lever bracket may be fastened either to the back head or the deck, as is most convenient.

Rail Failures During 1913.

The American Railway Engineering Association has just issued a bulletin containing a report on the rail failures for 1913, prepared by M. H. Wickhorst, engineer of tests, Rail Committee of the American Railway Engineering Association.

This report deals with the statistics of rail failures for the year ending October 31, 1913, furnished by various railroads of the United States and Canada in response to a circular sent out by the American Railway Association. The information furnished by each railroad showed the number of tons laid of each year's rolling from each mill and the total number of failures that had occurred in each year's rolling from the date laid until October 31, 1913. Heretofore only the failures occurring in the year covered by the report were shown, but in this report the total failures occurring since the rail was laid are made the basis of comparison.

The tonnages of rail represented by these statistics are shown below:

Year Rolled	Bessemer	Open-hearth	Total
1908	282,945	156,120	439,065
1909	432,155	461,261	893,416
1910	564,713	828,111	1,392,824
1911	276,933	646,809	923,742
1912	80,146	939,025	1,019,171
1913	63,472	793,557	857,209

Failures Classified by Mills.

For the purpose of determining the failure performance of the rails furnished by the different mills, the statements were first grouped between Bessemer and open-hearth steel. They were then grouped by steel mills, and each mill's tonnages grouped by the year the rail was rolled. Totals and averages were obtained for each of these groups.

Failures of Bessemer and Open-Hearth Compared

Year	Failures per 10,000 tons		Comparative failures	
rolled	Open-Hearth	Bessemer	Open-Hearth	Bessemer
1908	2168.9	302.1	100	112
1909	109.0	212.4	100	195
1910	57.6	132.1	100	229
1911	37.4	94.2	100	252

The rails for 1912 and 1913 are not included in this comparison, as they are probably too young for the comparison to be as reliable as for the older rails. Comparing the different years, the failures per 10,000 tons of open-hearth rails are proportionately much larger for the year 1908 (approaching the number of Bessemer failures), and this suggests the thought that there were faulty practices in the early rollings of open-hearth rails that were improved upon in later years.

In order to show the relative number of failures from each of the mills and to show the ranking of the mills as regards the failure performance of the rails rolled by them, the following table has been prepared. Taking the average number of failures per 10,000 tons of all the mills in any year's rolling as 100, the relative number of failures of each of the mills is shown for the years 1908, 1909, 1910 and 1911. The later rollings are not included because of being too young.

BESSEMER.

Mill	Rank	Relative failures
Maryland	1	56
Cambria	2	71
Lackawanna	3	89
Illinois	4	89
Carnegie	5	161
Algoma	6	191
Average		100

OPEN-HEARTH.

Mill	Rank	Relative failures
Colorado	1	20
Tennessee	2	26

Lackawanna	3	52
Pennsylvania	4	58
Maryland	5	76
Carnegie	6	96
Illinois	7	107
Cambria	8	136
Bethlehem	9	210
Algoma	10	312
Dominion	11	539
Average		100

The "100" given as "Average" it should be understood, is not obtained as the average of the column below which it appears, but is taken to represent the failure performance of the tonnage covered by these statistics of all the mills during the four years represented and for Bessemer and open-hearth rail separately. The "Relative Failures" give the number of the failures that occurred in the same tonnage that had 100 failures as an average of the rails of all the mills.

A retabulation was made of all the failure reports with special reference to the matter of performance of different sections and was divided into three groups as follows: Thick base high rails, or the A. R. A. type A group; thick base, low rails, or the A. R. A. type B group, and thin base, or A. S. C. E. group. The results indicate that the various types of section have about the same failure tendency, although on account of the differences in service no definite conclusions can be drawn as to the different types of section. The thin-base rails showed a somewhat larger percentage of failures as base breaks and broken rails, although the failures per 10,000 tons were about the same.

Comparisons were made of failures by weights of rail, but definite conclusions as to the failure performance of different weights of rail probably cannot be made from these statistics because of the difference of service to which the light and heavy rails are subjected. The comparisons indicate that the weight of rail per yard does greatly influence the failures per 10,000 tons.

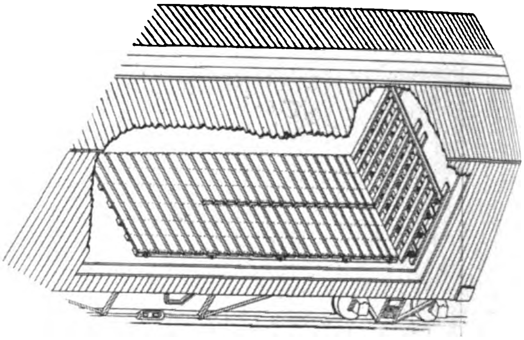
A comparison of the rails from the different ingot positions indicated that, as a general average, the failures classified as head failures of the "A," or top rail, were 2.7 times the failures of the other rails of the ingot in Bessemer steel and 1.8 times in open-hearth steel. In the failures classified as base breaks and broken rails the different rails of the ingot showed about the same failure tendency, or a little less in the "A," or top rail.

A comparison of rails made of steel treated with titanium with those of plain steel showed that in some cases the treated rails gave fewer failures per 10,000 tons than the plain rails, and in other cases the plain rails govern the smaller number of failures. As a general average the titanium-treated rails govern somewhat less failures per 10,000 tons.

The table showed that, after a period of service of five years, as a general average, about 1¼ per cent of the rails were reported as failed.

Shock Absorber for Egg Shipments.

THE accompanying drawing presents the general appearance of a device which has recently been invented for the purpose of protecting freight of a fragile nature against breakage due to shock while in transit. Patents have been applied for in the name of B. Monesmith of Cresco, Iowa and George E. Cutler, of New York City. In two experimental shipments of eggs from Cresco, Iowa, to New York City, in which this device was employed, both arrived at destination in perfect condition and each consisted of 400 cases, forming a refrigerator car load. The principles involved include the placing of the load upon a disengaged floor or platform free to move longitudinally upon the floor of the car but provided with means of absorbing the momentum due to this movement, without shock to the lading. In the shipments referred to, rollers were used to permit the longitudinal movement, while shock absorbers at each end of the car absorbed the motion in such a manner as to cause no shock to the contents of packages. How well this shock was cared for is well illustrated by the fact that in loading a space of about six inches remained unfilled at the middle of the car. This was loosely filled with straw and excelsior which on being unpacked at destination showed practically no evidence of having been compressed by the shifting of the load in the two ends of the car, and an egg placed in this space came through unbroken. The cost of the equipment as applied to these cars is stated to be about $30 per car.

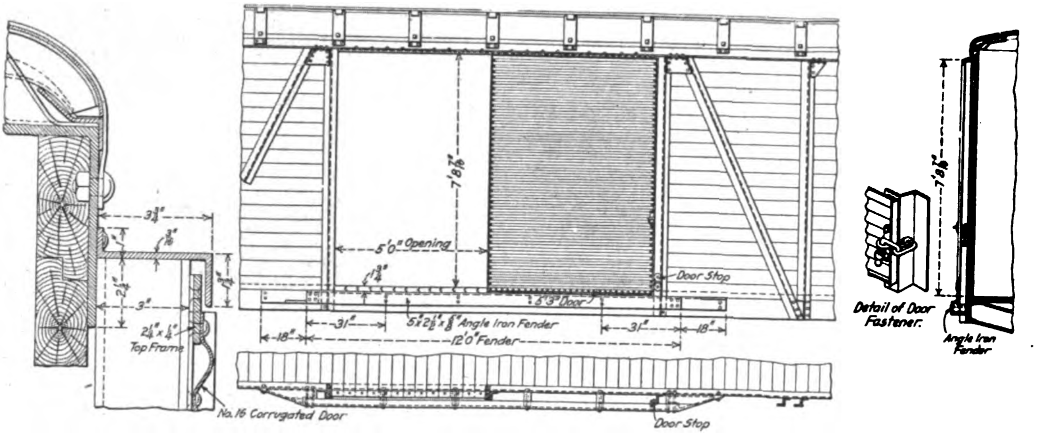


SHOCK ABSORBER SUCCESSFULLY EMPLOYED IN SHIPPING EGGS.

Steel Door with Fender Attachment.

THE American Car Roof Company, of Chicago, is manufacturing a corrugated steel box car door, fitted with a fender attachment to prevent the doors being raked by wagons or other obstructions, when the car is being loaded or unloaded.

The fender consists of a 5 in. by 2½ in. angle held out from the side of the car by means of cast filler blocks; at the ends snub-nosed castings are used. When shut the front end of the door fits into an angle, the idea being to prevent it from bulging out in case freight should accidentally fall against it on the inside. It is securely fastened by a one link chain and hook in the rear which it is believed is sufficient to keep the rear edge of the door from bulging out. This door does not run on pulleys, but is supported at the bottom near each end by hard bearing points.



Steel Door with Fender Attachment, Employed to Prevent Doors Being Racked by Wagons or Other Obstructions.

A Talk on the Locomotive Stoker.

Mr. J. C. F. STREET, manufacturer of the locomotive stoker which bears his name, gave an interesting talk before the October meeting of the Western Railway Club on the advantages of the modern locomotive stoker. He asserted that a stoker of the scatter type in order to be successful must measure up practically to all the following demands:

1. It must not break down.

2. It must do at least 90 per cent of all manual labor in taking coal from the tender and distributing it over the grate.

3. It must distribute coal evenly over the grate and provide means for firing heavy on any one section or zone in case the locomotive does not burn an even fire.

4. It must be constructed so that the fireman can at any time inspect the fire, rake it, and do shovel-firing without shutting off the stoker.

5. It must have several definite and marked rates of feed, have a capacity in excess of the maximum requirements, and feed coal continuously at any definite rate at which it is set and maintain that rate regardless of variations in steam pressure or grade amount or condition of the coal fed to it.

6. It must be constructed so that feeding to it bolts, spikes, rocks and any other foreign matter which may be in the coal will not result in a breakage and so that such matter or articles can be removed without taking the machine apart, in case they cause a clog.

7. It must have all parts easy of access for making inspection, repairs and lubrication.

8. The cost of inspection and running repairs must not be in excess of 75 cents per 100 locomotive miles.

9. It must be so simple in construction that the average fireman can understand the function of each part and be able to operate it successfully, after having received instructions during only one or two trips over a division.

10. It must have the opening through which coal is admitted covered with a screen which will reduce to a minimum the liability of the admission of foreign matter which will cause clogs.

11. It must handle wet coal.

12. It must keep a locomotive hot under all conditions with a lower grade of coal than is required for shovel-firing.

With reference to the class of locomotives which may be fitted to advantage with stokers, Mr. Street asserted that any locomotive, freight or passenger, which has a maximum tractive power of 50,000 pounds or over, should be so equipped, and in addition, any freight locomotive, which burns 4,000 pounds of coal per hour, continuously for periods of one hour or over, should also be mechanically stoked.

In discussing the advantages to be gained by the application of stokers, Mr. Street spoke in part as follows:

The primary object of applying a stoker to a locomotive is to enable the operation of that locomotive to its full capacity at all times and under all conditions, and this object is being attained wherever stokers have been applied.

There are only a few places where stoker-fired and shovel-fired locomotives of the same dimensions have been worked on the same division, and in the same class of service. Wherever this has been done the stoker locomotives have hauled a greater tonnage, and at a higher speed, than was possible with the shovel-fired locomotive.

The reason that this increased tonnage is possible is the fact that the fireman can secure and maintain the maximum steam pressure of his boiler at all times and under all conditions. It is not an uncommon occurrence on heavy freight trains for the engineer to work his cylinders at full stroke with the throttle wide open, both injectors on and maintain a speed of eighteen miles an hour. There is no difficulty in maintaining full steam pressure under these conditions and at this speed. It would be impossible for one fireman or any number of firemen to do this with a shovel, as the continual opening of the fire-box door reduces the fire-box temperature to a point which makes full steam pressure impossible.

In spite of the increased tonnage, there has always been an increase in the average speed of heavy freight trains, which is a great advantage where the traffic is heavy. As a result of this, the train dispatchers are some of the strongest advocates of stokers, as they say with stoker-fired locomotives they can handle the traffic much more rapidly than with shovel-fired.

This increased train speed results in a marked reduction in the over-time of train crews, as with the stoker-fired locomotive it is very exceptional for them to exceed the 16-hour law.

Another advantage which follows the use of stokers is in that the time required for cleaning fires, both at terminal and on the road, is very much reduced. A stoker fire clinkers much less than a shovel-fire, and statistics show, as a result of this, that it requires less than one-half as much time to clean a stoker fire as it does a shovel fire.

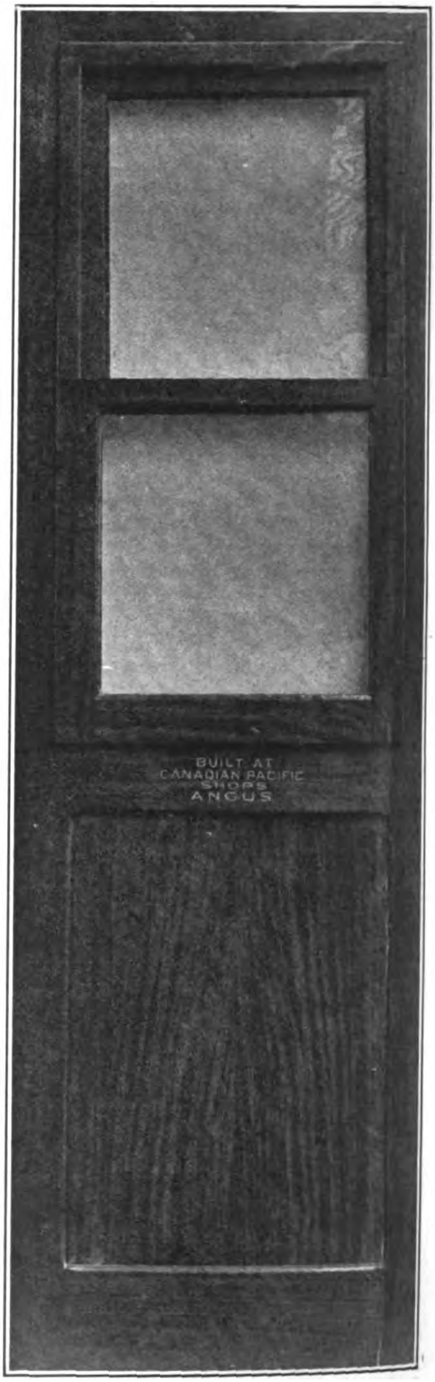
There has been a great deal of discussion on the question of fuel saving by locomotive stokers, and in some quarters there is an impression that a stoker-fired locomotive will burn more coal than a shovel-fired. The actual results show very clearly that, under average conditions, with an equal grade of coal, a stoker-fired locomotive will not burn any more coal than a shovel-fired, in proportion to the amount of work done. It is, however, an invariable rule, that stoker-fired locomotives are worked harder than shovel-fired, and are also given a poorer grade of coal. On many roads using stokers, they are giving the locomotives fitted with them a grade of coal which is so poor that it cannot be used successfully for shovel-firing at all.

It has been stated that one of the objections to a stoker on a locomotive is that it makes it too easy to waste steam through the safety valve. My reply to this is that a fireman who will waste steam through the safety valve with a stoker will do the same thing with a shovel. A railroad officer put this argument very hard to me as being a very bad feature against the stoker, and the next day, on his own road, I heard the safety valves on a switch engine blow full open for seven hours, without closing once. During that same period a large number of trains, both freight and passenger, came into the same terminal, and the pop valves on every locomotive, without exception, were wide open, and not one of them was stoker-fired. If the firemen were doing this with a shovel, what would they do with a stoker if this objection be valid? The fact of the matter is that there is less reason for waste at the pop valves with stoker-fired than with shovel-fired locomotives, because the fireman has better control of his fire. With shovel-firing he must leave a terminal with a heavy fire and full steam pressure, but with a stoker he can start out with very little fire, so long as it is clean, with his steam pressure from 15 to 25 pounds shy, and feel confident that he can have full pressure within ten or fifteen minutes at any time, and without regard to how the locomotive is worked. In fact, he knows the fire cannot get away from him—that he is absolute master of the situation at all times—and can control it without physical exertion.

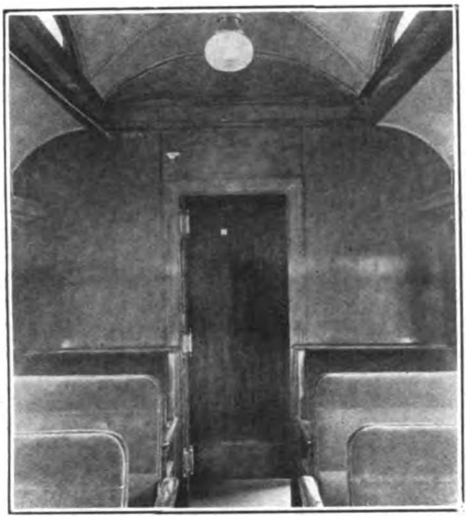
Veneered Steel.

A SUITABLE interior finish for passenger cars has been one of the problems which the railroads and car builders have been endeavoring to solve for some time and more especially since the advent of steel car construction. A suitable finish should in a general way possess the following qualities:— "Lightness, strength, durability, pleasing to the eye, poor conductor of heat, occupy a minimum of space and be fire resisting."

An all wood interior finish is bulky and does not seem to be in harmony with modern car construction. While it is possible by using great care to make a clever imitation of wood by using steel interior finish, the mere fact that



A Veneered Steel Door as Employed on the Canadian Pacific.



Bulkhead of Steel Passenger Car Built of Veneered Steel.

wood is imitated would seem to indicate that wood is the desirable finish but with the use of steel there are many disadvantages that do not seem to be much nearer solution than when steel was first used.

The steel surface is often wavy, even when new, particularly on flat surfaces. It is easily dented and the dents or buckles cannot be easily removed. It is very cold and noisy, and corrodes on the unexposed side.

It seems that the question of a suitable interior finish has been solved by the Canadian Pacific Railway. This is accomplished by the use of veneered steel. The veneer is of varying dimensions from 1-18 of an inch up, depending on the severity of service which is governed by the location in car and class of car.

This veneered steel is used in the construction of doors, panels, wainscot, bulkheads, sleeping car berths, sleeping car seat ends, etc., and is of approximately the same cost as steel or wood. It has the insulating effect of wood, is not subject to corrosion, as steel alone is, does not splinter in wrecks, is fire resisting and can be made attractive to the extent that one cares to go into the use of beautiful veneers. In other words, it combines all the good points of wood and steel with none of the disadvantages of either. It is not an experiment, as it has been used sufficiently long to demonstrate that it does not deteriorate. It is now in service on about sixty cars on the Canadian Pacific and its further use has been arranged for on diners, sleepers, coaches and all passenger carrying cars.

In the construction of doors, bulkheads, panels, etc., the veneer is used on each side of the steel and in this way oak, for example, can be used on one side and mahogany on the other, or any other class of wood that is desired. In the illustration, all of the wood in sight in the bulkheads, smoking room partition, etc., is of thin veneer, except the casings for the door frame and the moulding.

This veneered steel finish is the invention of Mr. R. W. Burnett, general master car builder, Canadian Pacific Railway Company, Montreal, P. Q.

Gasoline Switching Locomotive.

THE Motley County Railway has recently purchased a 300-horsepower gasoline switching locomotive from the McKeen Motor Car Company, of Omaha, Nebraska. The locomotive made the trip from Omaha to Matador, Texas, under its own power and is used in freight and switching service between Roaring Springs Junction on the Quanah, Acme & Pacific Railway and Matador, Texas. It has a tractive effort of 12,000 lbs. at 6 M.P.H. The motorman's position in the center and on the right side of the locomotive with an uninterrupted view in all directions, together with the air reverse control, enables the execution of signals with quite superior facility. Of the general features only the cab resembles the 200-horsepower locomotives built by the McKeen Motor Car Company, the 300-horsepower design being in the O-4-2 class.

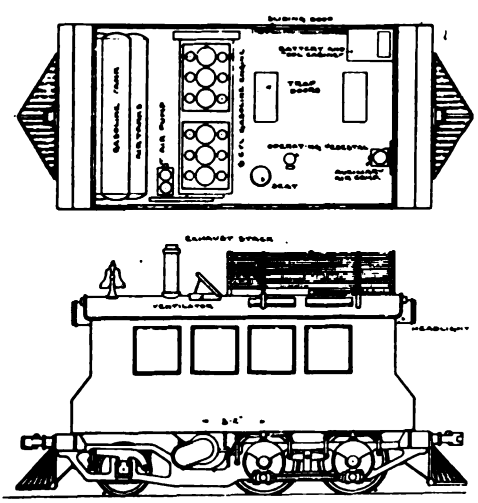
Frames are of cast steel, driving wheels 42 inches in diameter. The usual locomotive spring suspension with equalizers. The engine bed or shirk is a steel integral casting forming an efficient brace and reinforcement in tying together one side frame to the other.

The cab, an all-steel structure, covers the entire length of the locomotive frame between the bumper beams and is so bolted to the frames and buffer beams as to add very materially to the strength of the locomotive. All equipment accessories, etc., in the cab are conveniently located and do not obstruct the motorman's view in any direction.

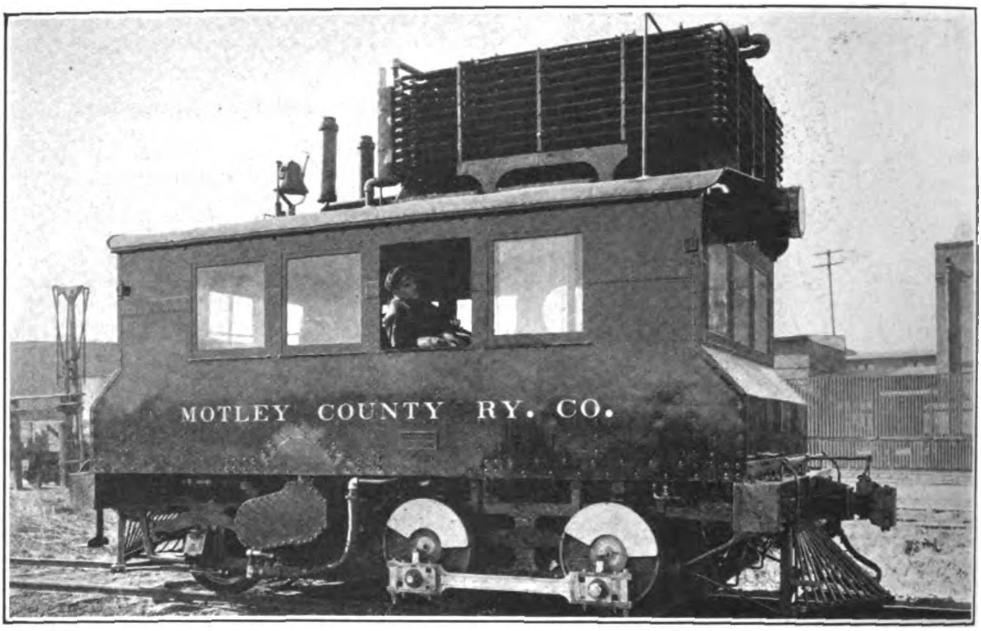
Headlights are operated by acetylene.

Straight air brake is used on the locomotive, which has a Gregory brake valve permitting the operation of automatic brakes on train.

The diameter and stroke of the internal combustion six cylinder engine is 11 in. and 15 in. respectively; general design and details correspond to the McKeen Motor Car Company's latest model (foolproof) Type C engine, the im-



Drawings Showing Interior and Elevation Views of New Gasoline Switching Locomotive.



Gasoline Switching Locomotive Manufactured by the McKeen Motor Car Company.

portant efficiency, reliability and economy developing details of which are—increased water circulation around valves and cylinder heads; Tungsten steel valves; piston triple rings; special compound hardened cams; faultless magneto; water jacketed intake pipes; enclosed fly-wheel, crank case and cam shaft, water and air pumps driving mechanism; combination splash and automatic lubricating system, all gears of the herringbone type.

Among the new characteristics is the use of two exhaust pipes, which extend through and above the roof. The engine is equipped with an air reversing mechanism which adds materially to the convenience and ease of the motorman. Two 5 in. air compressors are attached to the engine crank shaft, in addition there is an auxiliary air compressor in the cab for emergency service.

The ends of the front or main driving axle and rear driving axle have counterbalance crank discs which are connected by side rods.

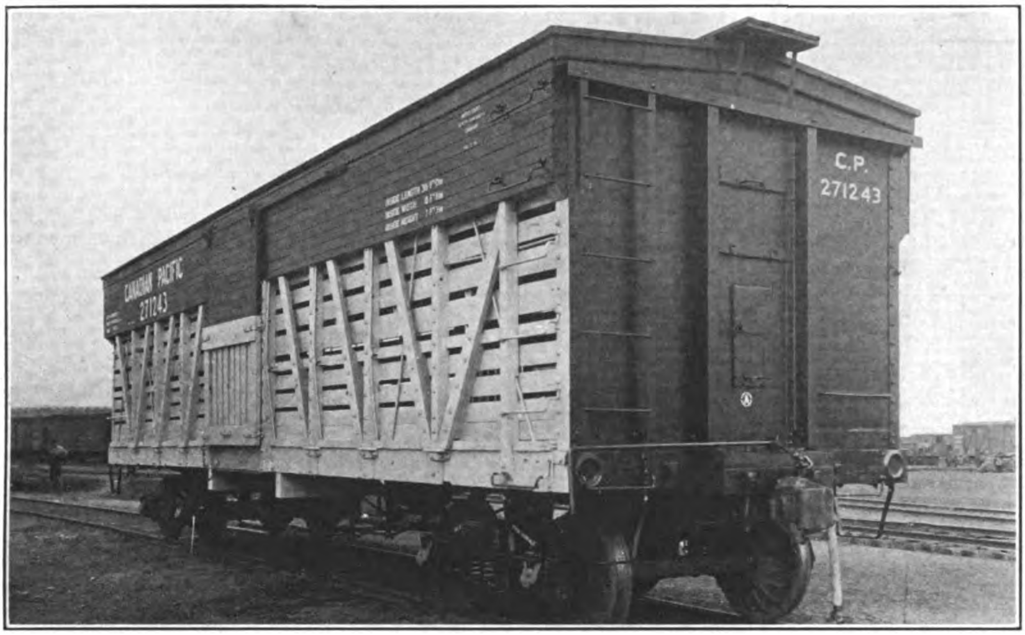
The power transmission, pneumatically operated, is effected by means of sprocket on the crank shaft, through a Morse chain to a sleeve working free on the rear driving axle and is then transferred through a multiple disc friction clutch, from which it is delivered by a Morse chain to the forward driving axle where, by an octoroon clutch the power is either magnified by a series of gears to produce heavy tractive effort and high torque for starting purposes, or is delivered direct to the driving wheels. By thus magnifying the torque of the internal combustion engine great starting effort is obtained for this style of locomotive. At the same time the locomotive once in motion, the higher economy is obtained by cutting out the gears and operating the direct connection.

The Company claims that a steam switching locomotive at many points is an expensive luxury, yet there is no economy in doing away with the switching locomotive and having the work done by freight train engines. The availability of the switch engine is more important than the speed. The steam switching locomotive has the expense of coal, water, sand, roundhouse and turntable service, the engine crew, ground crew, and while standing the consumption of coal and water goes on, for the boiler must be kept hot, in fact in many instances the engine is kept in serviceable condition 24 hours out of the day and frequently only used four or five hours.

Such situations are innumerable on the railroads of the United States, all of which could be put on an economic and efficient basis by the use of the gasoline switching locomotive, whose cost of operation would be in direct ratio to the daily time of service. Its availability for the 24 hours would not cost any more than its availability for six hours. In fact, gasoline switching service in small yards and at local points, etc., could be put on an efficiency basis so that the cost per unit would very favorably compare with the cost of larger units in large terminals where the switching service is operated 24 hours of the day. In other words, at many local stations where the switching is now done by regular freight trains it can be economically and expeditiously handled by the gasoline switching locomotive.

Canadian Pacific's New Thirty-Ton Stock Car.

STOCK car construction, while at all times consisting of considerable variations in design of details such as method of securing the side framing to the side sills, etc., has always followed the same general lines of wooden underframe and decking similar to box cars with side posts and braces similar to box cars but modified to suit the application of heavy slats on the inside only, except that when hay racks are used it is customary to apply sheathing outside hay racks.

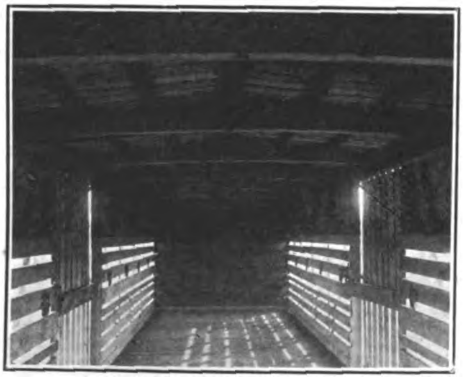


30-ton Stock Car Recently Constructed by the Canadian Pacific.

The fact that so-called stock cars are used for many other kinds of freight, such as lumber, rails, ties, pulpwood, pipe, etc., seems to have been ignored by many designers and builders. As a matter of fact, if a careful check was made on some roads they would find stock cars were used for this class of traffic considerably more than for live stock.

Even though the percentage of this traffic does not run high, the ends of stock cars will, on the average, receive more severe end shocks than box cars, because, with the exception of rails or similar loads of steel, the majority of the materials handled are piled high in the car and some of them, particularly pipe and pulpwood, are slippery, which causes them to produce very heavy shocks, while on the other hand box cars, being used for a greater variety of lading, do not so frequently have a load of this description.

This condition is not taken care of in many designs, some of which have been recently described in railway papers, and for this reason the photos and drawings of the latest type of car built by the Canadian Pacific will be of interest as illustrating how a very substantial end may be easily and economically applied to car of otherwise standard construction. This car is standard design that has given excellent service for some years, except that more recently all the new cars have been constructed with steel centre sills in connection with reinforced ends as illustrated in the drawing to eliminate draft gear troubles.



Interior of Canadian Pacific's 30-ton Stock Car.

The end construction is practically identical with the latest forty-ton steel frame box cars, same consisting of two 5 in. 11.6 lb. Z bar end posts, heavy angle corner posts, a 5 in. 11.6 lb. Z bar end plate securely attached to end post, corner posts securely attached to wooden side plate by means of gussets taking several bolts through the timber. The lower ends of the end posts are connected to the sill plate passing over the top of the wooden end sill and rivetted to the steel centre sill, thereby securely uniting the centre sill construction and end framing. The end lining consists of 2⅝ ins. T. & G. pine or spruce for a distance of four feet above flooring with 1¾ ins. thickness the balance of the height.

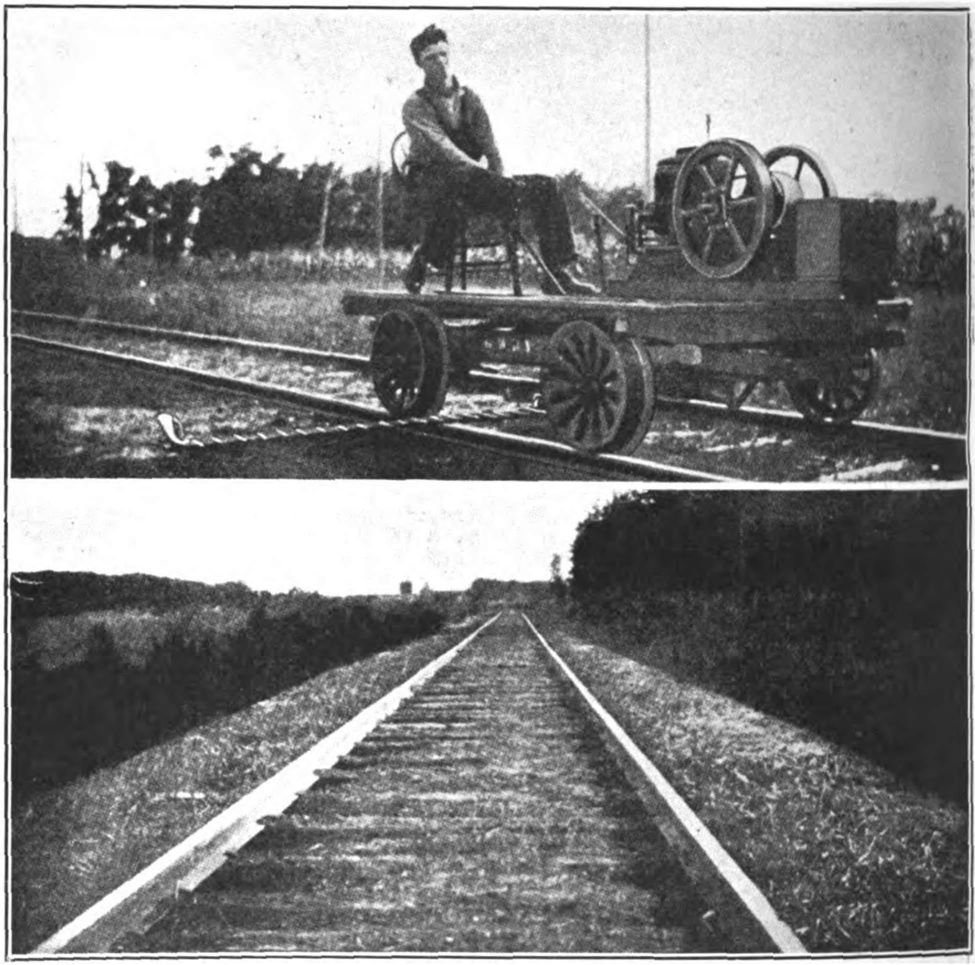
This construction produces a car that is economical in first cost and will satisfactorily withstand usual service conditions either for stock or other service and if damaged in accident can be easily and cheaply repaired.

The last order of these cars were equipped with socket castings inside of slats to support temporary decks. This temporary deck is so designed that if similar castings are applied, the same deck will be interchangeable in any 36 ft. car. When these castings are applied to a car, the sheathing board immediately below fascia is removed to provide ventilation for lading carried in upper deck. This alteration does not show in the illustration as the photograph was taken before the board was removed.

A Track Mowing Machine.

THE Chicago Great Western has recently been experimenting with a track mowing machine which has been constructed by one of its section foremen. This machine will mow a strip of from six to eight feet in width along the track and has affected a remarkable saving in work of this character. As indicated in the illustration, parts of a standard mower were mounted on a push car and the mowing device as well as the car were belted and geared to run with a 2½ H. P. gasoline engine placed on the forward end of the car.

The machine can be run at a speed of about four miles per hour and has been run twenty miles on one gallon of gasoline, so that the cost of mowing a mile of track has been reduced considerably more than one-half. The machine does more even and better work than men ordinarily do with scythes.



A TRACK MOWING MACHINE EMPLOYED BY THE CHICAGO GREAT WESTERN RAILWAY. LOWER PICTURE INDICATES THE RESULTS OBTAINED BY OPERATING THIS MACHINE.

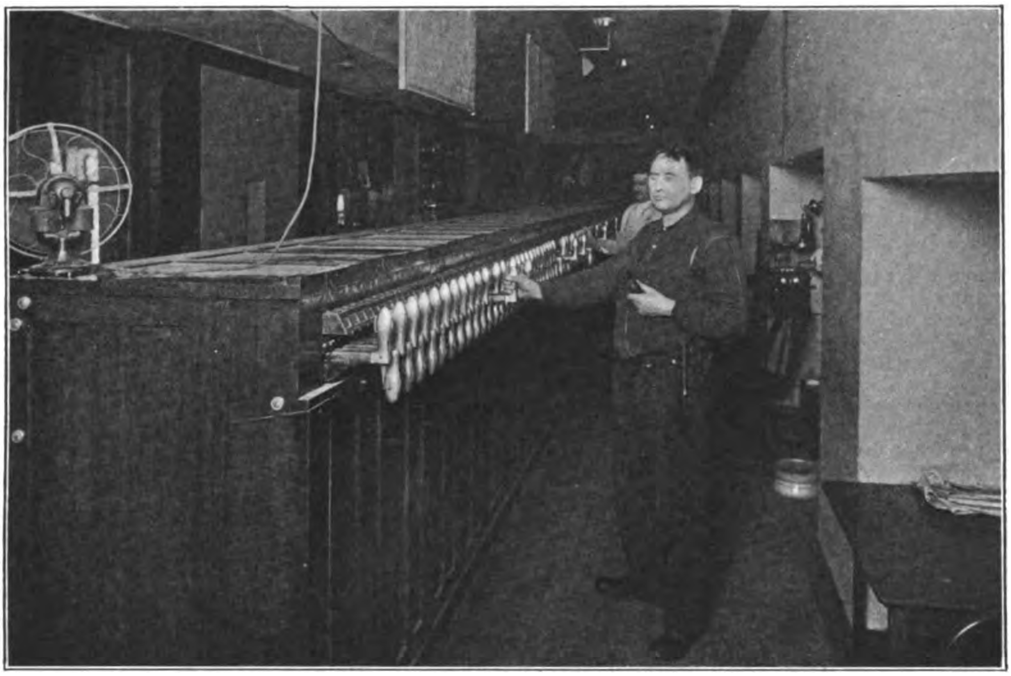
Electrical

The Electric Interlocking Signal Tower at Grand Central Terminal.

ELECTRICITY is becoming more and more of a factor in steam railway operations. Not only is progress being made in the propulsion of trains by this means, but its use is constantly being extended in the operation of these trains.

A striking example of its usefulness in this connection is illustrated by the wonderful electric interlocking signal towers "A" and "B" located at the Grand Central Terminal, New York. These towers represent the twentieth century idea in the electrical control of trains and they are responsible for the movement of hundreds of trains over the maze of tracks into and out of this terminal.

This remarkable, electrically operated yard, is



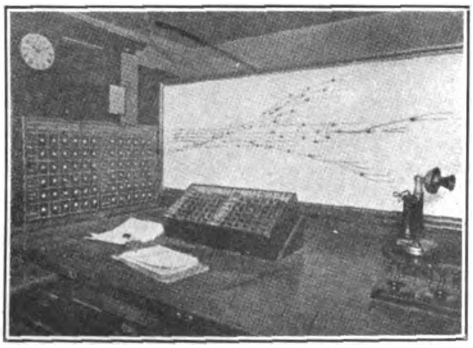
Electric Interlocking Signal Tower, Grand Central Terminal.

the largest thing of its kind in the world and to the perfection of its operation is committed the safety of millions of passengers each year.

In the old days it took an army of men to throw switches by hand in the terminal yards. Now three or four men pacing to and fro in front of a long row of little handles set the interlocking switches and the signals.

The machine is enclosed in an oak case 80 feet long, 5 feet high and 3 feet wide. Inside, but concealed from view, is a maze of electric wires—slender cords that resemble the seeming tangle at the back of a big telephone switchboard. In front, breast high, is a double row of metal handles, 400 in all, each with a straight grip a hand's breadth long, one up and one down alternately.

Over at one side of the room, about half way down its length, sits the tower director and close at hand are the various appliances for receiving and dispatching trains—telegraph, telephone, telautograph and a box containing electric bulbs to indicate the movement of trains to and from adjoining towers. On a frame of ground glass in front of the director is etched a map of tracks in the terminal, spreading out fanwise from the mouth of the tunnel under Park Avenue. A little circle about half the diameter of a dime marks the point where each track branches off.



Where the Tower Director Sits.

As soon as the train "hits the hill"—as they call emerging from the tunnel mouth—the first bulb lights behind the first of these little circles. The tower director knows that the train is coming, for he has been advised of its progress ever since it reached High Bridge or Mott Haven junction and knows just what he is going to do with it, just where he is going to place it, as soon as it gets within his reach. The tower director looks over to the men standing before the long row of handles and says, "124" or "53."

Each handle has a number above it. The man who has the number called within his division of the long box pulls the corresponding handle. As he does so he feels a tiny thrill that is the indication that the "high field" motor that controls the switch is doing the work. Then there is a gentle click, which is the second "indication," telling of the release of the armature magnet. A little square of ground glass above the handle is illuminated and shows that the switch and signal are set. Another little circle lights up on the tower director's map, another number is called, and so on until the train or the engine is at the end of its journey.

Should the tower director call a wrong number or should one of the men misunderstand him and pull the wrong lever the electric indicators would show the error at once. Not only that, but that particular section of the interlocking system of switches and signals on the tracks outside would show it to the eyes of the engineer.

Electric Arc Welding.

J. H. BRYAN, of the Westinghouse Electric and Manufacturing Company, delivered an interesting talk before the Western Railway Club on November 17th on: "Electric Arc Welding." After describing the various processes and classes under which such welding is divided, Mr. Bryan had the following to say with reference to its application to railway work:

Among the principal uses of arc welding equipment in steam railroad shops are the following: Flue welding; firebox repairs; frame repairs, and building up of worn parts. Besides these there are innumerable minor uses for the equipment.

General practice varies as regards the best method of welding flues. The time of welding will probably average 15 per hour, although as high as 25 per hour have been reported. This time is for 2-in. flues. Five inch superheater flues are being welded at about one-fourth this rate. It is interesting to note that the flue sheet is found to be in better condition upon removal of flues than is the case where flues have not been previously welded in. This is due to the fact that the welding builds up the sheet around the flue holes to about the original thickness.

Closely related to flue welding is the subject of firebox repairs. The defects to be repaired include cracks in the side, flue, door and crown sheets, leaky staybolts, leaky seams, etc. Also sheets will often be found to be in such condition that repairs are impossible, and it is necessary to put in patches. All of this class of work can be done very satisfactorily by the use of the arc welding equipment. Broken locomotive frames also are very satisfactorily repaired by the use of the electric arc. One railroad (R. F. & P.) reports that it has in service at the present time 65 welded locomotive frames and has had only one failure; this failure was attributed to the fact that the arc weld was in close proximity to one made by another process.

The following figures are taken from records of actual repairs made in a large railroad shop in the middle west at various times, the figures given being a comparison between the actual cost of welding and that of putting the apparatus back into service by methods previously used, either by replacement or by repair of the old parts. The arc welding costs were based on a power cost of 51 cents per hour for the carbon electrode and 17 cents an hour for the metal electrode, together with cost of labor and an overhead charge of 40 per cent. The power costs used are slightly higher than those usually obtaining in shops of this nature:

	Cost of welding	Cost by other methods
Plugging 51 holes in expansion plate, holes 1 in. diam. by ½ in. deep	$2.75	$10.15
Repairing mud ring	6.50	34.57
Cutting four 6-in. holes in tender deck sheet ½ in. thick	1.08	8.35
Welding eccentric strap, broken through neck	1.08	41.28
Repairing mud rings	6.50	24.57
Welding two spokes in driving wheel center	7.98	99.98
Welding cracks in bulkhead in tender tank	2.33	8.00
Welding cracks in side sheets	26.15	31.79
Repairing firebox	134.89	869.58
Building up flat spots on locomotive driver	.40	225.00

No hard and fast rules can be laid down as to the size of outfit required as no two installations will be alike in their requirements, and the matter of selection of apparatus of proper capacity is largly one of judgment and experience. In steam railroad shops installations are usually made of sufficient capacity to take care of not less than four to six operators, and the larger shops can occasionally use even greater capacities to advantage. Where a greater number of operators are to be supplied, however, it is generally found to be more economical to install additional outfits in other sections of the shop where welding is to be done, rather than to put in one large central plant. This is on account of the fact that as this work is usually more or less scattered the cost of line copper becomes an item for consideration.

Electrification Developments on the St. Paul.

CONSTRUCTION work in connection with the electrification of the Chicago, Milwaukee & St. Paul between Harlowton, Mont., and Avery, Idaho, has been resumed. Thus far the poles have been placed for a distance of thirty miles on the 116-mile division between Three Forks and Deer Lodge, Mont., which is the first to be equipped. The company has ordered nine freight and three passenger electric locomotives from the General Electric Company. These locomotives will be of the same construction except that those to be used for passenger service will be geared for a higher speed. The total weight of these locomotives will be 519,000 lbs. each, and the weight on drivers 400,000 lbs. They are to be delivered in October, 1915, at which time, it is planned, the construction work over the entire line will have been completed.

Terminal Improvements

St. Louis Railroads Unite on Centralized Ticket Offices.

WITH two exceptions, the railroads entering St. Louis have adopted a plan prepared by special committee of passenger traffic officers for centralizing their city ticket offices. The plan provides for separate offices for the various roads, seven to be located in a new five-story building to be erected on Broadway between Locust Street and the Boatman's Bank Building; three offices to be located in the latter building, and three in another building opposite, on Broadway. The roads which have not joined in the plan are the Vandalia and the Mobile & Ohio. Plans for con-

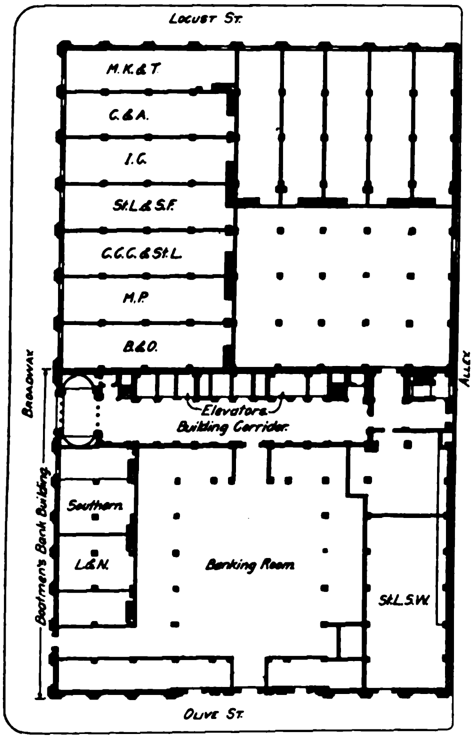


DIAGRAM OF THE CENTRALIZED TICKET OFFICES AT ST. LOUIS.

solidating the down-town ticket offices in St. Louis have been under consideration for several years.

It is believed that the plan will not only be far more economical than having separate offices in various locations, but that it will result in great convenience to the public. It is estimated that the plan will save the roads about $100,000 a year in rentals. After a decision on the location of the building had been reached the apportionment of the offices was made by lot. The Missouri, Kansas & Texas drew the corner of Broadway and Locust Street, which is believed to be the choicest location. The leases of the individual offices will run for ten years. Work on the new building is to begin immediately, and it is expected to be ready for occupancy by June 1st. Arrangements have been made to provide suitable space on Locust Street for such roads as do not have lines into St. Louis as may desire to locate in proximity to the selling offices of the initial lines.

Each of the roads will pay $3,000 a year rental, except that for the corner location, $4,000 will be paid. Two roads now pay $15,000 a year each for the rental of their city ticket offices, and others pay from $10,000 to $14,000 a year.

Memphis Railroads Open New Union Passenger Station.

THE Illinois Central and the Yazoo and Mississippi Valley Railroads have opened their new union passenger station at Memphis, the cost of which, including the station building, train sheds, platforms and track elevation, amounted to approximately $2,000,000. The terminal is also to be used by the Chicago, Rock Island and Pacific and the St. Louis and San Francisco roads. The main building which covers a space of 250x150 feet is eight stories in height. The building is of the Roman Doric type of architecture, Bedford stone having been used for the construction of the walls of the first three stories, and brick with terra cotta trimmings for the additional five stories. These latter stories constitute the office portion of the building and are devoted exclusively to offices of the Illinois Central and Yazoo and Mississippi Valley roads. One of the features of the building is an emergency hospital on the fourth floor which is equipped with all modern, sanitary and medical appliances.

The main entrances to the station consist of five large doorways on Main Street, at the sidewalk level, and there are additional entrances on Calhoun Avenue leading directly to the waiting room for colored passengers and to a carriage-way and cab-stand. In addition to these there are separate exits on both streets named for white and colored passengers, so that passengers leaving trains do not need to pass through the waiting rooms. The ticket office, with a frontage of 80 feet, is at the level of the main entrance, and separated by only 30 feet therefrom is the baggage, check counter which is 50 feet long. The concourse is 35 feet wide and 125 feet long and is well lighted and ventilated. The entrance and exit gates to the track platform are another half flight above at the lower end. Another half flight above is the main waiting room and connecting with this room, are the resting rooms for women and smoking rooms for the men.

The track arrangement includes five stub tracks and five through tracks, the stub tracks being used by trains of the roads having a Memphis terminal at the station. Stub track trains are reached directly after passing through the train gates by a half flight of stairs and for through trains the concourse continues, with a width of 25 feet under the through tracks and leading from this extension are half flight stairways for reaching the platforms at the track level. The

Interior View Showing Concourse of New Union Passenger Station at Memphis.

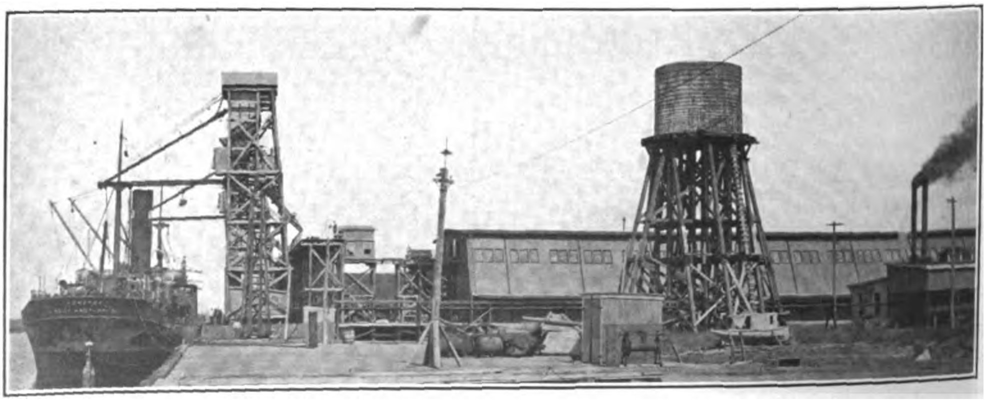
platforms which are seven in number, are 700 to 940 feet long, while two of them are reserved exclusively for trucking, baggage, mail and express so as to relieve passenger platforms of that burden. Umbrella sheds extend over the full width of all platforms and where baggage, mail and express are handled, baggage elevators are operated from the ground floor to the track platform level.

Southern Railway's Improved Shipping Facilities at Brunswick, Ga.

To provide facilities for promptly and economically unloading vessels arriving at Brunswick, Ga., with cargoes of fertilizer material, salt, cement and similar commodities handled in bulk, Southern Railway Company has recently constructed on property adjoining its Turtle River docks and warehouses, a modern warehouse with a complete mechanical unloading plant.

The new warehouse, known as "Warehouse K," is 101 feet wide and 301 feet long and 50 feet high from the floor level to the ridge of the roof, which gives it a capacity for about twenty thousand net tons, equal to 700 ordinary freight car loads. The foundations are of re-enforced concrete and the structure itself consists of a heavy wooden frame, thoroughly braced, on which is placed a corrugated metal sheeting, protected by a composition of asphalt and asbestos. The roof is of wooden sheeting covered with tar and gravel.

The mechanical unloading plant consists of two movable wooden towers, each about eighty-five



New Warehouse at Brunswick, Ga., Which Greatly Expedites the Movement of Bulk Freight.

feet high, which run on steel rails on a wharf in front of Warehouse K, parallel with the water front. An elevated railway, back of the tracks supporting these towers, carries small electric motor cars which move from the elevating towers over scales, which automatically weigh each load, into the warehouse where three tracks allow discharge in the desired compartment. These cars have a carrying capacity of slightly over 5,000 pounds each and receive their power from a "third rail." They are constructed so that each load may be dumped quickly in any one of the specified compartments without stopping.

The material to be stored is raised from the holds of the vessels into the storage bin at the top of the elevating towers by means of buckets holding 3,000 pounds, which are operated by high speed steam hoisting engines especially designed for this work. The operating machinery of this plant is guaranteed to have a minimum unloading capacity per tower of forty tons per hour.

The economy and efficiency derived from the installation of this up-to-date mechanical unloading device is so far superior to the donkey engine and hand car methods formerly in use at this point, and the warehouse itself is so modern and commodious, that these new facilities are expected to attract wide attention to the port of Brunswick, as a point for the most advantageous distribution of the materials, which the warehouse will handle, and consequently prove of advantage to all interior points reached by Southern Railway and its affiliated lines.

Interstate Commerce Commission

Commission Issues Its Annual Report on the Statistics for Railways for 1912.

THE Commission will shortly have ready for delivery, the 25th annual report of the Statistics of Railways in the United States for the fiscal year ending June 30, 1912. Owing to a large demand the Commission reports that it is impracticable to make a general distribution of this report. Arrangements have, therefore, been made by which copies may be obtained from the Superintendent of Documents, Government Printing Office, Washington, D. C., for $1.00 each, or copies of the text for ten cents each. The full report contains 719 pages while the text contains but 65 pages. It is stated as important that any copies wanted be ordered at once from the Superintendent of Documents and not from the Commission, as only a limited edition will be printed.

The report is divided into three sections: Section A including abstract of reports rendered by steam railway companies having annual operating revenues above a hundred thousand dollars; Section B containing abstract of reports rendered by lesser steam railway companies and Section C contains table showing single track mileage and intercorporate relation of steam railway companies on June 30, 1912. In addition, there are two appendices showing mileage and intercorporate relations of switching and terminal companies on June 30, 1912, and also a condensed balance sheet statement of switching and terminal companies.

The Commission's Recommendations to Congress.

THE Interstate Commerce Commission in its report to Congress on the 10th inst. (for the period from December 1, 1913 to October 31, 1914) makes the following principal recommendations as to new legislation:

"That the use of steel cars in passenger train service should be required and that the use in passenger trains of wooden cars between or in front of steel cars should be prohibited.

"That there should be appropriate and adequate legislation upon the subject of control over railway capitalization.

"That there should be legislation to make explicit and certain the authority of the Commission to examine all correspondence, files, indexes and other papers and documents retained by carriers subject to the Act.

"That for the purpose of uniformity and to prevent injustice, there should be provided by law one period—in the Commission's opinion three years—for the beginning of all actions relating to transportation charges, subject to the Act.

"That the penalty for violations of the hours of service Act be changed to a fixed and definite sum, or that a minimum penalty of $100 be established instead of the penalty of 'not to exceed $500,' as now provided."

Various decisions of the Commission carried to the Supreme Court are discussed in some detail with reference to their application to Interstate traffic. On the interpretation of the long-and-short-haul clause the Commission in part says:

"Subsequent to the announcement of the decision of the Supreme Court transcontinental carriers applied to the Commission for a modification of the order which would afford them sufficient time to publish and file with the Commission, effective on statutory notice, new schedules of rates conforming to the requirements of the order. They also urged that changed conditions resulting from increased water-carrier competition justified some modification of the order as to the rates on a limited number of commodities respecting which the water competition was alleged to be particularly severe and to have necessitated relatively low rates. These commodities, comprising approximately 110 items, are said to move in large quantities by water from the East to the Pacific Coast, and the rates which the rail carriers can obtain on this traffic are alleged to be limited and controlled by the rates of the water carriers. The rail carriers urged that as to these items they should be accorded a further hearing to show that they were entitled to a greater degree of relief than was afforded by the Commission's order. Such hearing was held at Chicago on October 6, 1914, and all interested parties were afforded opportunity to present testimony. Tariffs have been filed, effective November 15th, covering all other commodities, more than 400 in number, containing rates that are in conformity with the rule of the fourth section as modified by the Commission's order. The rate from New York City and related points to South Atlantic and Gulf ports and from Ohio River crossings to New Orleans and other Mississippi River crossings were found to be strongly influenced by water competition, and relief was afforded to the carriers operating routes between such points.

"The rates to interior points not located upon navigable streams had in some instances been adjusted by the carriers with relation to the rates to water-competitive points with a view to enabling such interior points to distribute freight in the surrounding country in competition with water-competitive points. The adjustment of rates from many points to Atlanta, Athens, Cordele and Rome, Ga., Birmingham, Ala., Meridian and Jackson, Miss., and other points similarly situated, lower than to intermediate points was intended to permit those cities to distribute in competition with other points located upon navigable waters. The Commission believes such adjustments of rates to be improper under the fourth section of the Act, because it creates undue preference at these points, which are thereby enabled to distribute in competition with other points more favorably located, while intermediate points through which the traffic is carried are charged higher rates and are unable to distribute on equal terms with the points so favored.

"The order entered in these cases denied authority to continue lower rates from Cincinnati or Louisville to Atlanta, Birmingham, Cordele, Athens, Jackson or Meridian than to intermediate points. It also denied authority to continue lower rates via direct lines from New Orleans to the above-mentioned points than to intermediate stations. The interested carriers, in conformity with the order, are making a check of all the rates to all the points involved in this territory. A supplemental report and order 32 I. C. C., 61, has been issued by the Commission, modifying in certain particulars the original order in such a manner as to permit the establishment of a harmonious and properly graded rate structure. This new adjustment is a work of great magnitude and necessitates the reissue of nearly, if not quite, all interstate tariffs in the entire territory involved covering more than 40,000 miles of railway."

The work of physical valuation of the railroads, the report says, is well under way. With the coming of winter, the field parties are being transferred from Northern roads to those in the South. Eight parties are surveying about fifteen hundred miles a month. The number of parties will be increased on January 1st to about twenty for each of the five districts. During the year the Commission has further considered the matter of railroad operating costs. On June 13, 1914, it issued a report which requires Class One roads, embracing carriers whose revenues exceed $1,000,000 per annum, to separate their operating expenses between freight and passenger service on certain prescribed bases. The division of statistics, in co-operation with committee representing the American Railway Association and the Association of American Railway Accounting Officers, is at present at work in devising a plan, the report says, for accomplishing the results contemplated which will not be unduly burdensome to the carriers and which will at the same time yield statistical data of a fundamental character of value alike to the carriers and to the Commission. Upon the completion of this preparatory work a proper order will be entered, it is stated.

State Commissions

Convention of National Association of Railway Commissioners.

THE convention of the National Association of Railway Commissioners was held in Washington, November 17th, 18th, 19th and 20th. The address of welcome was made by Commissioner Clements, of the Interstate Commerce Commission, who laid stress upon the necessity of uniform recognition among the several sets of underlying principles of rate making and rate adjustment, which should be the guide everywhere in arriving at concrete results which will be reasonable and just. "It is manifest," he said, "that in no other way can the just purpose of regulation both state and federal, be accomplished. Divergent and conflicting state policies which become the basis of state rate fabrics, will continue to produce irritating and intolerable conditions of discrimination, for which some remedy will have to be found. I know of no feature or regulation which demands more than does this frank, thorough and courageous discussion and treatment. It cries aloud for co-operative action."

Laurence B. Finn, president of the association, in his address, advocated that regulation and control by authority of state and federal governments should embrace every detail of activities of common carriers, including investments, construction and operation. On account of entangling alliances between transportation companies and other big business industries, common carriers have never had a fair chance to demonstrate their maximum benefit to the public. Legislation to remedy the evil of interlocking directors will become effective October 15, 1916, but in the meantime anxiety of banks, industrial and commercial institutions over welfare of carriers might not be based solely upon their concern in general welfare of the republic. He held that an employe does not lose his efficiency when employed by the government, and that employes of private corporations are not more proficient than those engaged in government service.

"Duplicating a public utility either in construction or operation, which serves the same communities," he said, "results in an economic waste. Therefore, economy demands the elimination of competition between public service enterprises and by force of this economic condition, a monopoly in transportation is necessary. If a private monopoly is indefensible and intolerable, should not a necessary monopoly be publicly owned?"

The report of the committee on railway service and railway accommodations, O. H. Hughes, of Ohio, chairman, declared that "more deaths are occasioned by improper ventilation of train coaches and waiting rooms than by train accidents. The noxious gases that fill coaches, especially sleeping cars, in connection with the peculiar character of dust therein, is most conducive to germ-breeding where proper ventilation is lacking." In regard to the lighting of coaches, the report says that this problem on trunk lines has been fairly satisfactorily mastered, but on many branch lines the dingy, dirty oil lamp is still in evidence. The same may be said of waiting rooms. While giving the railroad credit for progress in lighting and heating coaches, the heating, lighting and ventilation of waiting and toilet rooms is deplorable. The committee recommends a vigorous campaign against this condition of affairs. Determination of the number of trains and their schedules should be made by traffic managers rather than by superintendents, as the former are conversant with the requirements of the public while the latter may not be. Irregularity and failure of suburban trains to arrive and depart on time is the cause of wide complaint. To a limited extent the committee recommends the carrying of passengers on freight trains where passenger trains are so infrequent that time and money could be saved by the use of freight trains. The committee recommends the elimination of the practice of paying freight bills carrying manifest overcharges. Delays in handling and settling claims are also condemned, and the committee concludes that the best means of minimizing such delays is to require the railroads to pay interest on the true claim amount from the date the amount of the claim went into their hands.

While great strides have been taken in the movement to simplify freight tariffs, more remains to be done. Further efforts at simplification should be made by eliminating, as far as possible, technical terminology, abridged language and complicated phraseology. One cause of the car shortage evil is the constant effort to make tonnage records at the expense of speed. The heaviest possible loading is sought and the acceleration of deliveries is wholly overlooked. On the question of substitution of steel for wooden cars, the committee recommends that the Interstate Commerce Commission be given full power to prescribe the character of equipment to be used in interstate commerce.

The report of the committee on statistics and accounts, B. H. Meyer, of the Interstate Commerce Commission, chairman, recited the progress made during the last year in work bearing upon the statistics and accounts of common carriers, notably that of the Interstate Commerce Commission and the State Commissions in Nebraska, Oregon and New Hampshire. Its recommendations are as follows:

"Your committee believes that the various accounting orders of the Interstate Commerce Commission are well adapted to the needs of the State Commissions, and it therefore recommends that the State Commissions adopt them completely. Such adoption will secure a uniformity in accounting not otherwise practicable, and will permit the accumulation of a body of statistics which will become increasingly valuable as the period of years becomes greater. * * *

"We also recommend that the committee on statistics and accounts for the ensuing year be instructed to revise the state forms for annual reports of steam railway companies to conform as closely as practicable to the revised form of annual report to be adopted by the Interstate Commerce Commission."

Chairman Decker of the committee on express service and rates reported that the express companies suffered a loss of approximately $10,000,000 in gross revenues last fiscal year, compared with the preceding year. Operating income was reduced from $4,415,000 to $404,429. These figures, Mr. Decker thought, constitute a basis of apprehension and serious consideration. "In the comparatively near future," he said, "we are likely to have under consideration the question of providing sufficient revenue for a continued profitable operation of the express service over railroads in the United States." At present the express companies pay about fifty per cent of their total receipts to the railroads, a fact calling for an analysis in connection with the continuation of the express service to the public at reasonable rates.

VALUATION.

The subject of valuation was brought before the Association in the second day's meeting in the form of reports from two committees which had co-operated on their respective phases of the question. The standing committee on railroad taxes and plans for ascertaining fair valuation of railroad property has had certain parts of the subject of valuation under consideration; but in addition, at the 1913 convention, a general committee on physical valuation was appointed, which in turn had an executive committee of which Milo R. Maltbie, of the Public Service Commission, First District, New York, was chairman.

Mr. Maltbie, reading a report on the work of the general committee, stated that that body had held four conferences in Washington during the year and has been able to advise the valuation department of the Interstate Commerce Commission in the work of appraisal recently begun by that department. As valuation work has already been done by several of the state commissions, the committee felt that it was entitled to speak with considerable force. The committee took the position that the department of valuation should report to the Interstate Commerce Commission "the vital and fundamental facts necessary to a complete appraisal, but should not attempt to settle the questions of public policy, finance and law that are involved. These must be settled by the Interstate Commerce Commission, and if the department of valuation were to prejudice them, and if the department were not in accord with the Commission, much of the work done by the department might be useless or subject to extensive revision."

Inventories, the committee believed, should be prepared by the railroads which should submit to the department of valuation complete lists of all property. "Every company," says the report, "ought to have such an inventory. It appeared at the start, however, that the railroad companies did not have complete lists, that in many instances even the records of their real estate holdings were incomplete and that none of them had a full set of maps showing in detail the nature and amount of construction work that had been done upon their right of way."

The committee held that an inventory is entirely separate and distinct from an appraisal; that no common date can be fixed for all inventories, and that the only practicable method "is to use a date at the end of a fiscal year and then to direct companies to keep their records in such a way that the inventory may be brought up to date at any moment without such a long examination as is necessary in case of an original inventory of appraisal."

As to abandoned property, the word "abandoned" should not be taken too literally, because, for instance, a circuitous right of way for which a more direct line has been substituted could not be classified as abandoned property if the company retained title, even though the land were not used for any company purpose.

In regard to the appraisal of land owned by the companies, the committee suggested that the Interstate Commerce Commission obtain: 1. A complete inventory of all land owned, showing separately that used and useful wholly for railroad purposes; that used and useful partly for railroad purposes; that used for other than railroad purposes, and that not used for any purpose, care being taken in all cases to show the extent of use. 2. The original cost of land and the form of compensation. 3. Land donated or granted by public authorities and the conditions of such grants. 4. Bequests of land from other sources and the conditions. 5. Extent of structures upon land when acquired, destroyed or utilized, and how utilized. 6. Date of acquirement and dedication to railroad use. 7. Special assessments, such as for sewers, streets, parks, etc. 8. Legal fees and other expenses connected with acquisition. 9. Amount of land sold or conveyed to others. 10. Compensation received in such cases. 11. Date of such sale or conveyance.

The source of funds was also regarded by the committee as of great importance, and the department of valuation should have knowledge of the extent to which property has been paid for by the issuance of securities or out of surplus income or out of operating expenses. If a company has included in its operating expenses items which it now asserts are part of its capital investment, it is an error. The extent to which the public, either through governmental aid or through associations and individuals, has donated property or contributed funds to railroads, should clearly be shown. In this connection, the committee pointed out that the Interstate Commerce Commission, in its new system of accounts, provides that the entire cost of a piece of property shall be charged to capital account and that any donations made toward such costs shall go to profit and loss account and thus become immediately available for dividends. This, the committee holds, is erroneous, as the company would be entitled to charge rates based upon the cost as shown in the capital account, and in this way would get a fair return "not only upon the investment of the company, but upon the amount of money which had been contributed to the company by the public. Why the stockholder is entitled to dividends which have not been earned, and the public required to pay a return upon their own donations, is not explained."

John M. Eshleman, of California, chairman of the committee on railroad taxes and plans for ascertaining fair valuation of railroad property, read the report for that body. The report called attention to the work done by the President's Conference Committee appointed by the railroads to co-operate with the Interstate Commerce Commission in the valuation work.

"It may well be expected that nothing will be left undone by the representatives of these great enterprises to bring about a valuation as favorable to their contentions as is possible. It is plainly apparent that the carriers do not consider that the effect of this valuation work will be seen alone in rates but it is also quite likely that a basis of valuation for possible sales to the government may be contemplated," said the report.

"It is our belief that the work mapped out in the statute directing the valuation is impossible to be accomplished in its entirety, but we further believe, proceeding under this statute, the Interstate Commerce Commission will develop the difficulties of the plan. While we are not pessimistic as to the value of this work, still we believe it will not meet with the expectations of those who framed the statute under which work was undertaken. And we most strongly urge the necessity, both on the part of the Interstate Commerce Commission and the states, of being awake to the program of the carriers involved to lay a foundation for proceedings in court which may utimately vitally affect both regulation, while regulation exists, and public ownership should the government find it necessary to enter into the ownership of the railroads of this country."

The committee alluded to the inventory and appraisal forms which call for entries in three columns headed "Original Cost to Date," "Cost of Reproduction New" and "Cost of Reproduction Less Depreciation." The committee suggested that clean cut definitions of these three terms be made to avoid confusion. It suggested that inasmuch as the tentative valuations made by the Interstate Commerce Commission must be submitted to the governors of the states in which the property valued is located, that copies of the field notes made by the commission's representatives should be furnished to the representatives of those states as well as the railroads.

TELEPHONE AND TELEGRAPH RATES.

The report of the committee on telephone and telegraph rates and service, A. P. Watson, of Oklahoma, chairman, discussed the question whether from an economic standpoint public service commissions should approve the theory of regulated monopoly or that of open competition in utilities of the same character. It is believed that with properly controlled monopolies, the greatest possible reduction in rates, due to the greatest efficiency of plant, is within reach.

UNIFORM CLASSIFICATION.

The report of the committee on uniform classification and simplification of tariffs, Clifford Thorne, of Iowa, chairman, was in abstract as follows:

While appreciating the many advantages of uniformity in classification of ratings, the committee suggests careful consideration of the cost of such uniformity. If it is to be obtained by a general revision upward, the committee doubts the general feasibility of the movement. It would be much better to sidetrack the movement than to pile up a large annual tax upon the public in order to pay for it. The country's transportation fabric has been built up piece-meal. Commercial conditions have adapted themselves to it, and we are now paying the penalty of haphazard growth. Entire uniformity cannot be secured in one year or several years. While thoroughly appreciating the right of individual states to retain full jurisdiction over intrastate traffic, the committee believes that the states should materially aid in the work of uniformity by adopting, whenever practicable, the general classification of the territory in which each state is located. Much confusion is caused by innumerable tariffs applicable to the same traffic, and one state is cited where in order to cover interstate traffic, it requires more than 20,000 tariffs and supplements.

Many complicated questions arise in the work of simplifying tariffs. Group rates, when fairly adjusted, are desired by shippers, but in making group or zone rates conflicts develop with existing combinations of local or through rates. Some progress in the simplification of tariffs is being made, but at times it seems disappointingly slow. Attainment of a uniform system must come through patient and persistent effort and gradual changes. Hasty or ill-advised steps would create confusion and hardship.

The committee especially recommends the plan for simplification of class ratings devised by E. E. Williamson and W. B. Barr. This contemplates the basic rates, all others being computed by a percentage applicable to the basic rate.

There is no reason, in the committee's opinion, why substantial uniformity in rules, regulations, minimum weights, description of articles and package requirements should not come within a very short time as to the general features of classification. Uniformity in ratings is another matter, with many additional problems, and this subject should be left to the judgment of the Interstate Commerce Commission. If such power is given to the Commission, neither the State Commissions, the railroads, nor the public generally will seriously criticize careful, conservative action as to rates.

The committee recommends the readoption of the resolution passed by the association last year and two years ago, that there should be appropriate legislation by Congress, authorizing and directing the Interstate Commerce Commission to frame and promulgate a classification of freight to apply uniformly over the United States.

Rails and Equipment.

The report of the committee on rails and equipment, C. C. McChord, of the Interstate Commerce Commission, chairman, approached the subject from the standpoint of accidents. The committee had analyzed the reports of train accidents for ten years from 1904 to 1913 inclusive. During this time there were 127,371 train accidents caused by collisions and derailments on steam railroads; responsible for 8,805 deaths, 127,542 injuries and a property loss of $104,625,897. The collisions numbered 62,082 and were responsible for 5,078 deaths, while the derailments numbered 65,291 and were responsible for 3,727 deaths. The property loss was $47,433,501 in the case of collisions, and $57,192,596 from the derailments.

Of the derailments, more than 66 per cent were caused by defective roadway and equipment, and the reports show that derailments are increasing each year. Defective equipment was responsible for 45.65 per cent of all derailments, for 13 per cent of the fatalities, 16.13 per cent of the personal injuries and 41.93 per cent of the property losses. For the last year (1913) these proportions were generally larger, defective equipment being charged with 48.13 per cent of all derailments; 14.67 per cent of the fatalities; 19.06 per cent of the personal injuries and 41.19 per cent of the property losses. In that year car wheel failures were responsible for 28 out of every 100 derailments due to defective equipment and for 36.74 per cent of the fatalities thereby occasioned.

The committee had made a careful inquiry into the cause of rail failures and finds that they occur mostly during the winter months, reaching a maximum in February. It has been the experience of a number of roads that the maximum of failures occurs when the rails have been from three to four years in the track. The committee complained of the barrenness of relevant data on failed rails and urged the importance of collecting information from examinations of the fractured rail ends by experts.

On the subject of steel cars the committee declared: "There can be no doubt that steel cars are better and safer than those of wooden construction. Experience in collisions and derailments in which direct comparisons have been made furnishes abundant proof on this question." The committee added that the construction of wooden passenger cars has practically ceased. On January 1, 1914, there were under construction a total of 3,144 cars, of which but 15 were wooden passenger cars and only two of these were intended for the use of passengers. The following table shows the distribution of steel and wooden cars throughout the country:

Section:	No. of Roads	Steel No.	%	Stl Undfr No.	Wood No.
New England	8	105	2.1	153	5,033
East	64	3,767	26.3	1,430	14,287
Southwest	50	235	4.9	681	4,786
Northwest	28	355	9.7	154	3.662
Southwest	38	389	12.0	332	3,228
West	38	2,526	27.2	2,230	9,281
Sleeping Car Cos...	1	2,115	49.4	*628	4,283
Total U. S.......	227	9,492	21.3	4,608	44,560

The committee in conclusion remarked that there has been a noticeable increase from year to year in the loads to which rails and equipment have been subjected, and the increase is still going on. In no other situation involving danger to life, says the report, "is material used with so slender a margin in strength, judging from the annual statistics of accidents." In comparison with other engineering uses of materials of construction, "knowledge of the working stresses in railway materials is in a very backward state. In fact, it is hardly apparent that diligent efforts have been made to supply this deficiency." The committee suggested consideration of the question whether there should be some state or federal supervision of this class of material which is exhibiting so many failures.

---

*Wooden cars reconstructed with steel underframes.

RATES AND RATE MAKING.

The report of the committee on rates and rate making was read by Prof. E. R. Johnson. Earnest efforts continue to be made, the report stated, to discover a practical and rational standard to apply in the elaboration of rate schedules, and in passing upon the reasonableness of rates against which complaints are made before public service commissions. It is not probable that the majority of students of this question have as yet agreed upon any single basis or standard that may control in rate making. While rates continue to be made by the carriers and to be passed upon by regulatory commissions by the exercise of individual judgment, rather than by the application of any accepted formula or standard, there are two very noticeable present tendencies in the theory and practice of making and regulating rates: to give greater weight to cost or service in rate making and to recognize a close relationship between railroad securities and railroad rates. One member of this committee is of the opinion that cost of service can be and ought to be made the basis of transportation charges. This member recently expressed his views in a letter to the chairman of the committee, in the following language: "My position is that the cost of service can be fairly accurately ascertained, and that it should be ascertained, and that this cost should be modified by the value of the product graded and classified, and by such other commercial conditions as may affect each particular case. I have made rates on this basis for several years and I find that in the long run it is the safest basis to pursue. Of course, I realize that apportionments cannot be made with absolute accuracy. On the other hand, I find that they can nearly always be brought within five per cent of where they should be. In view of this it seems to me that the cost method is not only safe but necessary." The committee maintained that this testimony by a man who has had years of experience in rate making, is of great significance, and declared it to indicate that the cost basis of rate making has less practical difficulties than most transportation students have associated with that basis. If one expert can apply the cost basis without difficulty to the problems of rate making, the committee said, doubtless others can, and it is possible that the cost principle may find increasing acceptance year by year.

The committee referred to the proposed federal regulation of issues of railway securities. In this connection the report said: As long as it was the generally accepted belief that there was little, if any, connection between the volume of securities issued by the railroad and the rates that it charged, the relation of railroad securities to rate making was considered by many persons to be an academic question; although the public generally has always felt that in some way or another the railroad would try to secure from the rates charged enough revenues to pay interest on all the bonds issued and to give the stockholders dividends upon the outstanding capital. As a matter of fact, the rates actually made have been determined both by competitive or commercial conditions and also by the pressure exerted upon railway managers by the fixed charges which railway companies have to bear. Whatever may have been the past theory as to the relation of rates to capitalization, it is now strongly urged by the carriers that they cannot issue securities to secure necessary addition to capital without increasing rates; and the argument of the carriers seems to be meeting with the approval of many classes of business men. The relation of rates to railroad securities is becoming a very present question. The problems of rate making must be considered jointly with the capital requirements of railroads, and with the policy of the public as regards the regulation of railroad securities. Rates are no longer controlled solely by extra-human competitive forces. It is recognized by everybody that rates and revenues are now largely influenced by the theory and practice of the public officials vested with the authority to prescribe or revise transportation charges. This fact makes it increasingly important that serious students of transportation should endeavor to agree upon practical and equitable standards or bases of railway charges. Unfortunately this committee is unable to solve this question which has long vexed both traffic managers and railway commissioners. Little by little, year by year, the problems of rate making will be worked out by the practical experience of railroad officials and railway commissioners.

The report of the committee on statistics and accounts of electric railways was read by Dr. F. A. Weber, statistician of the New York first district commission, chairman.

MR. PROUTY ON VALUATION.

Charles A. Prouty, director division of valuation, Interstate Commerce Commission, delivered an address which was in the nature of a report upon the progress of federal valuation and the developments in connection with the work. "Probably the most important practical question before this country to-day," said Mr. Prouty, "is its treatment of our railroads, and I have felt that this valuation which we are to make must have a profound influence upon its discussions. There is, first, the primary question: Is the government to take over these agencies of transportation, or shall they be left to the operation of private capital? This question never can be satisfactorily answered in the minds of most people until we know what relation that actual value bears to the present outstanding securities. A definite answer to that question, one way or the other, will undoubtedly profoundly affect public opinion upon this question.

"Assuming that we are to leave the discharge of this function to private enterprises, there arises the even more difficult question as to what the treatment of this private capital shall be. What rates shall be accorded in order that the present investment may be fairly dealt with and that such further investment will be induced as will render possible the proper development of these facilities. In the past this question has not been acute, for rates have been sufficient to maintain railroad credit, but it is evident that the time is at hand, if it is not already here, when there is grave doubt as to whether these rates must not be generally increased. This question cannot be satisfactorily answered until there is a national valuation of these properties."

"When completed, the national valuation should be as far as possible a finality," said the commissioner. "When once this valuation is made, the law requires the Commission to keep it good from year to year. If the purpose of the act is carried out, it will be possible in a half century to turn back in the files and ascertain the exact condition of each railroad fifty years ago.

"It has been too much the fashion in the past to assume that whatever was required of a railroad cost nobody anything," he said. "The error of that notion is fast becoming evident. It is becoming plain that somebody has to pay, and that somebody is, in the last analysis, the general public. In these times, when carriers are insisting that rates must be advanced, and when they are supporting that claim by a showing which at least makes all of us stop and think, we are extremely reluctant to squander several million dollars in a mere duplication of work, if that could be avoided." Mr. Prouty then explained some of the plans for valuation, which, it is hoped, will eliminate duplication of work and result in a fair division of expense between the government and the carrier.

"The Commission has not yet determined the relation between present value and reproductive value," he said, "nor has it determined what value is to prevail in the final valuation of the property itself. A very sharp difference of opinion will undoubtedly be found here between the carriers upon one side and you gentlemen of State Commissions on the other, but that question has not yet been considered by the Commission, nor is it yet ripe for consideration."

The speaker described the work of the accounting department, which is headed by a supervisor of accounts in general charge of the work, with a district accountant in each district. It is the aim of this department to develop the financial history of the property, what has been received from the sale of stocks and bonds—in short, what has been actually paid in to the company from the outside, what return has been paid upon these amounts in the past, and what relation they bear to the outstanding capitalization of the company and to its reproductive and investment cost. "The great doubt," he said, "exists as to what we ought to attempt as to 'original cost to date.' The act requires the Commission to show with respect to each piece of property exactly what should be done in obedience to this requirement of the statute. * * * I had never seen until I read the report of Mr. Eshleman to this convention the definition of the California Commission of 'original cost to date.' I had, however, from discussion with our people and reflection, reached substantially the same conclusion embodied in that definition as I understand it. Were it possible to go back to the beginning and to re-write the accounts of a carrier down to the present time the property account of that carrier, as thus shown, would be the original cost of its property to date."

He said the accountants had endeavored to do this, but that the work was so voluminous and expensive, as well as difficult, that a simpler plan had to be evolved. It is possible, however, he said, to a considerable extent to show the original cost of lands, and there are peculiar reasons why the original cost of the right of way should be known. The Commission certainly should attempt to obtain such information in case of lands and rights of way, certainly when used for common-carrier purposes. It is also possible, he said, to show the original cost of rolling stock with considerable accuracy and to determine the cost of any subsequent additions as should properly be treated as betterments. The division also, he said, will be able to show the total money investment in the property, and this is, perhaps, after all, he thought, the most significant thing.

As to the probable cost of the valuation work, the speaker said his original estimate was approximately $50 a mile to show the cost of reproduction and the cost of reproduction less depreciation in the manner in which the work should be conducted. He saw no reason to change that estimate, provided the work can be done in a fairly economical manner.

"What must be expended in our accounting work depends entirely upon the extent to which that work is carried. The work is necessarily expensive and of great interest and value, but I have never felt that the outlay need be excessive. Whatever the amount needed to complete this work in a proper manner should be expended. * * * In this valuation work no penny should be expended in unnecessary detail, but the work should be done in such manner as will not only commend itself to the judgment of you and me, but in such a way as will also satisfy the average intelligence of this country as correct. It should be done once for all, if possible. This is the economic thing, both for the carrier and for the government.

"Consider for a minutes the enormous amounts involved. An error of six to seven per cent in the valuation of our railroads means nearly or quite a billion dollars. The interest at six per cent upon that sum is sixty million dollars. Whether this valuation is to be used as the basis of rates to be allowed these carriers and paid by the body of our people, or whether, perchance, it may become the measure of the price to be paid by the government for this property, that error would mean either to the railroads or to the people every year three or four times the total amount of the entire valuation. Certainly we should all insist, first of all, that the work be done in a proper manner, and that it be not impaired in quality for the purpose of reducing the expense."

The election of officers resulted as follows: President, Clifford Thorne, of Iowa; First Vice-President, R. B. Prentis, of Virginia; Second Vice-President, Max Thelen, of California; Secretary, R. Hudson Burr, of Florida; Assistant Secretary, James Blaine Walker, of New York.

Amendment of Act to Regulate Commerce.

On Thursday, the committee on an amendment to the act to regulate commerce, Chairman William D. Williams, of Texas, offered a resolution which would preserve the integrity of states in rate-making for interstate traffic, and which directly brought up the question as to whether the Interstate Commerce Commission or State Railway Commissions should have the rate-fixing power within state lines. Lawrence B. Finn, of Kentucky, president of the association, and John M. Eshleman, of California, vigorously supported the resolution. They contended that the states were better informed than the general government as to conditions within their borders. Mr. Eshleman laid stress on the contention that the states should be given supreme power in this matter, at least until the Interstate Commerce Commission's powers are increased by Congress to give it competent jurisdiction over intrastate rates. He declared that the Interstate Commerce Commission at present is without the power to fix intrastate rates.

Car Service and Demurrage.

The report of the committee on car service and demurrage, Clyde B. Aitchison, of Oregon, chairman, stated that while the association in 1909 adopted a uniform code of demurrage rules which was subsequently endorsed by the Interstate Commerce Commission, it is still far from general acceptance. In a few states the code was opposed by Commissions who held their own rules better adapted to local conditions, and in some states statutes stood in the way of its adoption. Such statutory obstacles can be and should be overcome, the report said. The carriers are not without blame for failure to give the rules wider acceptance says the committee. If the railroads should choose to put them into effect as to interstate business, they can do so merely by publishing and filing the necessary tariffs.

As to reciprocal demurrage, the report says: "The committee sees no reason to depart from the frequently announced opinion of the association that fairness to the shipper demands he be given an effectual, prompt, and adequate remedy for dereliction of duty on the part of a carrier failing to supply his cars reasonably as he orders and needs them, and that such penalty as the law imposes for such failure should be requited as promptly and cheerfully by the carrier as the penalty imposed by law for detention of cars is to be met by the shipper."

Shipper's Claims.

The committee on shippers' claims, James S. Harlan, chairman of the Interstate Commerce Commission, chairman, reported that it had obtained statistics from the Interstate Commerce Commission which reflected, to some extent, the progress being made by carriers in the investigation and adjustment of claims. From these statistics, which cover the period from January 1st to June 30th, 1914, steam carriers having annual revenues exceeding $1,000,000, and representing 220,062 miles, or approximately 90 per cent of the total mileage of the United States, reported a grand total of 2,421,996 claims presented, of which 1,895,432 were adjusted. The period of adjustment varied from fifteen to 180 days. At the end of the six months' period there remained unadjusted 529,564 claims, or 22 per cent of the claims received. The majority of the unadjusted claims were presented in the last thirty days of the period under consideration. This shows that 78 per cent of the claims received were adjusted, and of those adjusted 88.6 per cent were paid, 9.8 per cent declined, and 1.6 per cent withdrawn. "These percentages," says the report, "tend to refute to some extent the assertion so often made that carriers purposely evade payment of a large proportion of claims." The total amount of claims adjusted for loss and damage during the six months' period was $17,185,818, and of this amount 43.81 per cent has been charged to two causes, namely, "unlocated loss," 23.96 per cent; and "unlocated damage," 19.85 per cent.

In recent years there has been an abnormal increase in the payments for loss and damage to freight. In 1900 the amount paid on this account was $7,055,622, while in 1913 it was $30,885,454—an increase of 357 per cent. During the same time, freight earnings have increased 109 per cent, showing that the increase in payments for loss and damage is entirely out of proportion to the increase in freight business. In assigning causes for this disproportion, the report mentioned the tendency of shippers to use a cheaper and frailer grade of shipping containers. Public interest requires that carriers insist upon the use of substantial and adequate boxes, cartons, and other packing cases. Another cause is the tendency of carriers toward a more liberal treatment of claims; another that many claims for loss and damage which formerly did not exist are now presented, owing to the increasing practice of shippers to employ men of railroad experience who are quick to find a basis upon which to present claims.

Upon the information obtained, the committee believes that some portion of the large payments for loss and damage is not a proper charge against carriers, especially in the case of claims for alleged losses to shipments of packing house products, grain, fruits and livestock. Uncertainty of the law respecting freight claim liability is cited as among the practical difficulties under which freight claim agents now work. Overcharging and undercharge claims against shippers, the report says, have been accepted as a sort of necessary evil incident to the handling of a large volume of business. The report concludes as follows:

"As a general proposition, carriers adjust overcharge claims with a fair degree of promptness. It appears that all carriers are not as diligent as they might be in their efforts to detect overcharges and to arrange voluntarily to refund them without waiting for a claim, although it is undoubtedly true that there has been a substantial improvement in this respect. There appears to be even greater lack of diligence in the detection and collection of undercharges. It frequently happens that shippers are not advised of undercharges until months, sometimes years, after the shipping transaction occurred. In such cases the shippers, having disposed of the matter, object to paying additional charges, and when informed that under the law they must pay the charges demanded, they feel that they are being imposed upon; and, thereafter, not infrequently assume a hostile attitude both to the law and to the carriers." It is plainly the duty of carriers, said the committee, to make substantial efforts to correct the conditions which create such errors.

State and Federal Authority.

The question of interference between state and federal authority in the fixing of interstate rates was again the subject of debate, on Friday, November 20th. After protracted and at times heated discussion a recommendation was adopted, that Congress enact a law providing that the Interstate Commerce Commission should not interfere with the operation of any state-wide rate or regulation until such rate or regulation had been declared by the courts to be unreasonable. This recommendation was embodied in a resolution proposed by Commissioner William D.

Williams, of Texas. It induced a discussion of the principle involved in the Shreveport rate case. It was held by a majority of the convention that the decision of the United States Supreme Court in that case seriously curtailed the rate-making powers of State Commissions.

Clifford Thorne, of Iowa, new president of the association, insisted that if the commonly accepted idea of that decision should become effective, "state regulation would be dead" and that "all state-made rate schedules would fall like houses of cards." An effort was made to refer the whole matter, involving state rights, back to the committee, with directions to report to the convention next year. On a roll call of states, the motion was defeated, 22 to 11. By an aye and no vote, the Williams resolution then was adopted.

The convention adopted the following resolution: "That property shall not be entered upon the books of account of any company in excess of the actual cash cost." The convention also adopted a resolution recommending the appointment of a committee of three to revise the forms of annual reports made by railroad corporations to the several State Commissions with power to act.

A committee consisting of commissioners from fifteen states was appointed to join in a protest to the Interstate Commerce Commission against the granting of increased freight rates on commodities handled by railroads west of the Mississippi River until they have time to thoroughly examine into the necessity for such increases.

Following a discussion of the pending Reyburn railway securities bill which has been endorsed by the Wilson administration, a resolution was adopted declaring that the federal government should not seek to place its authority paramount to that of the states in the matter of the issuance of railway stocks and bonds. This resolution reads as follows:

"That it is the sense of this association that the issue of stocks and bonds by common carriers and other public service corporations shall be regulated and controlled by governmental authority, but that the regulation and control of issue of stocks and bonds by the federal government shall not be in lieu of but in addition to the authority of the several states in such matters."

The convention adjourned on Friday. It had been decided previously, in fact such action was taken at last year's convention, to meet in San Francisco, Cal., in 1915, the date fixed being October 12th.

Pennsylvania.—The Public Service Commission has issued the following administrative ruling specifying its authority with regard to advances of passenger rates made within the State:

The Public Service Company Law, Approved July 26th, 1913, Article 2, Section 1, (f) Provides in part as follows:

> "To make no change in any tariff or schedule, which shall have been filed or published or posted by any public service company in compliance with the preceding sections, except after thirty days' notice to the Commission and to the public, posted and published in the manner, form and places required with respect to the original tariffs or schedules, which shall plainly state the exact changes proposed to be made in the tariffs or schedules 'then in force,' and whether an increase or decrease, and the time when the proposed changes will go into effect;" * * *

The term "then in force" as employed in the paragraph above quoted must be interpreted as requiring that a tariff or schedule filed and posted must be allowed to become effective and remain in effect for at least thirty days before any change may be made therein, unless specific authority be granted by the Commission, but this will not affect tariffs or schedules containing rates for excursions limited to certain designated periods under authority of General Order No. 4, of 21st day of January, 1914.

New York.—The up-State Public Service Commission has just issued its regular quarterly pamphlet containing abstracts of the quarterly reports made to it by the operating steam and electric railroads of the State. These abstracts contain condensed balance sheets for each company as of June 30, 1914, with corresponding figures for June 30, 1913, and condensed income statements showing not only revenue and expenses, fixed charges, etc., as reported for the three months ending June 30, 1914, but also cumulative income statements for the fiscal year ended on that date.

The pamphlets also contain certain statistical data throwing light on operations during the quarter, such as the amount of freight and the number of passengers carried, ton-miles, passenger-miles, car-miles, etc.

The pamphlet may be obtained on application at the office of the Commission in the Capitol, or at the Commission's New York City office, Room 210, Metropolitan Tower.

TRAFFIC.

Official Classification Meeting.— The Official Classification Committee began a meeting at New York on the morning of December 14th for the consideration of a great number of subjects including changes in ratings, descriptions and package requirements. The meeting is of particular importance as numerous changes in present ratings are under consideration.

The Record of Traffic Through the Panama Canal During the First Quarter Year of Operation.—During the first three months of commercial operation of the Canal, from August 15th to November 15th, the cargo transported through the Canal has amounted to 1,079,521 tons.

During the fiscal year ending June 30, 1914, the Panama Railroad carried 643,178 tons of through freight between the two seaboards, and in the preceding fiscal year, 594,040 tons. From this it is seen that between six and seven times as much cargo is pasing over the Isthmus now as passed over this route when goods were transshipped by rail. The traffic through the Canal in the first quarter of its operation has been equal to about 88 per cent of the through traffic over the Isthmus during the preceding two years.

The toll charge on loaded vessels of $1.20 per net ton, Canal measurement, has been found in this period to be equivalent to a charge of approximately 75 cents on each ton of cargo. The revenue of the Panama Railroad from each ton of through freight during the fiscal years 1913 and 1914 was $3.06. Each through freight train carried an average of 353.21 tons of cargo in the fiscal year 1913, and an average of 302.77 tons in the following year. The average amount of cargo carried on the laden vessels passing through the Canal (in which the 27 vessels which have made the transit in ballast, or are, by nature, not cargo-carriers, are not counted) has been 5,835 tons.

The traffic eastbound through the Canal, or from the Pacific to the Atlantic, and that westbound, or from the Atlantic to the Pacific, are summarized below:

Month	Eastbound *Vessels*	 *Cargo*	Northbound *Vessels*	 *Cargo*	Total *Vessels*	 *Cargo*
Aug.	12	57,182	12	49,106	24	106,288
Sept.	30	186,776	27	135,262	57	322,038
Oct.	41	252,288	43	168,069	84	420,357
Nov. 1-15..	19	124,834	28	106,004	47	230,838
Total ...	102	621,080	110	457,991	212	1,079,521

Over 95 per cent of the traffic may be grouped under these four routes: The United States coastwise trade, the traffic between the Pacific coast of the United States and Europe, the trade of the west coast of South America with the Atlantic seaboard of the United States and with Europe, and traffic from the Atlantic coast of the United States with the Far East.

COASTWISE TRADE.

Eastbound United States coastwise traffic carrying general produce of the Pacific coast to the Atlantic seaboard, has employed the transit of 42 vessels, carrying 250,888 tons of cargo; to this may be added three vessels laden with 14,500 tons of lumber, making an aggregate of 45 vessels with 265,388 tons.

The traffic from the east coast of the United States to the Pacific coast has engaged 43 vessels, carrying 206,482 tons of general merchandise and manufactures, and seven vessels laden with 34,487 tons of coal, an aggregate of 50 vessels, with 240,969 tons.

The coastwise trade has, accordingly, employed 95 vessels, transporting 506,357 tons of cargo. This is 44.8 per cent of all transits, and 46.9 per cent of all cargo.

UNITED STATES WEST COAST AND EUROPE.

Traffic to Europe from the west coast of the United States has consisted of nineteen vessels carrying 136,488 tons of grain, and seven vessels carrying 57,600 tons of general produce, and one vessel with 7,760 tons of gasoline, a total of 27 vessels with 201,848 tons. Traffic from Europe to the west coast of the United States has employed three vessels, carrying 14,603 tons of general merchandise and manufactures.

SOUTH AMERICAN WEST COAST.

The traffic from the west coast of South America to the United States and Europe has included sixteen vessels carrying 111,846 tons of nitrates, of which the ultimate destination has frequently been determined after the vessels left the Canal; one vessel with 6,200 tons of barley, from Valparaiso for Falmouth; one vessel with 5,278 tons of general produce, from Africa to Liverpool; two vessels with 14,900 tons of iron ore from Cruz Grande to Philadelphia; and two vessels with 12,220 tons of general produce, from Valparaiso to Baltimore. The aggregate of this outward traffic has been 22 vessels with 150,444 tons of cargo.

Traffic to the west coast of South America from the United States has consisted of one vessel with 6,010 tons of coal, from Norfolk to Valparaiso; and seven vessels, with 40,746 tons of general manufactures, from New York for distribution between Callao and Valparaiso, an aggregate of eight vessels with 46,756 tons. Traffic from this coast from Europe has consisted of three vessels with 11,350 tons of coal, and two vessels with 5,532 tons of general manufactures, all from Great Britain. The traffic to the west coast of South America has been thirteen vessels, with 63,638 tons.

TRAFFICS TO THE FAR EAST.

The trade from the Atlantic seaboard of the United States through the Canal to the Far East has been comprised as follows: To Japan, three vessels with 17,570 tons of refined petroleum and petroleum products, and seven vessels with 25,258 tons of general cargo and 14,817 tons of raw cotton; to China, four vessels with 24,730 tons of refined petroleum; to Australia and New Zealand, three vessels with 22,498 tons of general merchandise, and two vessels with 12,701 tons of refined petroleum.

The total exportation to the Far East through the Canal has amounted to 117,574 tons, carried in nineteen vessels. None of these vessels has returned to the Canal, and no cargo has been shipped through direct from the Far East to the United States or to Europe.

MISCELLANEOUS.

Only five loaded vessels have passed through the Canal on routes other than those described above. They have been the "Capella," carrying 3,400 tons of whale oil from Magdalena Bay to Norway; the "Kingsway" and the "Burcombe," carrying respectively, 4,659 and 4,550 tons of coal from Great Britain to Esquimault; the "Bankdale," with 5,943 tons of coal from Norfolk for Guaymas, Mexico; and the "Wilhelmina," with six tons of general cargo for the Government of Nicaragua. The five vessels carried an aggregate of 18,558 tons of cargo.

SUMMARY.

The traffic over the several routes may be summarized, as follows:

	Vessels.	Tons of Cargo.
Coastwise, eastbound	45	265,388
Coastwise, westbound	50	240,969
U. S. Pacific coast to Europe....	27	201,848
Europe to U. S. Pacific coast....	4	21,102
S. America to U. S. and Europe.	12	150,444
U. S. and Europe to S. America.	13	63,638
U. S. Atlantic coast to Far East.	19	117,574

Miscellaneous traffic	5	18,558
Vessels without cargo	27	....
Total	212	1,079,521

ORGANIZATION NOTES.

Annual Meeting of Railway Fire Protection Association.—The Railway Fire Protection Association held its second annual convention at the Hotel Raleigh, Washington, D. C., on October 6th and 7th. The president of the organization, F. H. Elmore, superintendent of insurance of the Southern Railway, presided at the various sessions.

The President's address called attention to the preliminary work to which the association's first year had been devoted and noted that the real work of the society, to prescribe the methods of fire protection, had hardly been begun. He emphasized the necessity of co-operation, first, on the part of members in their relations with the various committees, and, second, on the part of the society towards the operating department, expressing the opinion that once the interest and support of the operating officer were secured, accomplishment would be assured. The real work of the society, therefore, he said, lies in devising practical, economic and effective ways and means for the protection of and the prevention of loss to property. Its province is to develop standard practices and to play the part in the railway field that the National Fire Protection Association plays in industry in general; it must prove to the operating officer and to the later association that it is the authority in its branch of the subject.

The report of the executive committee showed that the society had increased its membership approximately 57 per cent, and recommended the establishment of a number of new committees.

The Committee on Fire Hazards, Charles N. Rambo (Norfolk & Western) chairman, presented a report.

Forthcoming Annual Meeting of National League of Commission Merchants.— The 23rd annual convention of the National League of Commission Merchants of the United States, will be held in Detroit, Mich., at the Hotel Cadillac, January 13th to 15th inclusive, for the election of its officers, and for consideration and discussion upon all problems affecting transportation and marketing of fruits, vegetables, butter, eggs, poultry, etc.

The scope of the League's operations and representation extending to 38 of the largest and most important cities and marketing centres of the United States, will naturally make the discussions at this annual meeting of vital interest to all sections of the country. Therefore, its sessions are open to the public.

Resolution of the American Association of Traveling Passenger Agents.—The American Association of Traveling Passenger Agents which assembled in California during October, after having inspected the progress of the work on the buildings and grounds of the Panama-Pacific International Exposition, placed itself upon record as follows:

First.—That the Association is profoundly impressed with the nobility of the scale on which this exposition is planned, and with its wonderful beauty in detail.

Second.—That the Association is struck with the astonishing progress of the work, all the exhibit buildings being completed and the installation of exhibits from the forty-three states and territories and forty foreign countries going on.

Third.—That in the opinion of this Association there is no doubt that the Exposition will be completely ready on its opening date, February 20, 1915.

Fourth.—That in the opinion of this Association the Panama-Pacific International Exposition, in plan and execution, in grandeur and conception, and in beauty of detail in programme and performance, will be commensurate with the great national event which it celebrates, creditable to the nations which celebrate, and an honor to California, the hostess state.

Fifth.—And it is hereby

Resolved, That the Panama-Pacific International Exposition, in educational value, in artistic stimulus, in beauty and in interest, justifies the members of this Association in urging every one who wishes to be abreast with culture to come and stay long at the Panama-Pacific International Exposition.

International Engineering Congress, 1915.—Some confusion seems to have arisen in the minds of at least certain of the engineers of this country, between the International Electrical Congress, which it was proposed to hold in San Francisco in September, 1915, and the International Engineering Congress, which IS TO BE HELD during the same month.

Owing to the unfortunate situation existing abroad, and the impossibility of convening the International Electratechnical Commission, under whose authorization the Electrical Congress was to have been held, it has been decided by the governing body of the American Institute of Electrical Engineers to indefinitely postpone the holding of the Electrical Congress. This does not affect the International Engineering Congress, which goes ahead as originally planned.

Marked progress is being made in connection with the latter, and papers have already been received from several of the foreign countries, and everything points to a successful issue.

The Committee of Management of the Congress wishes to impress upon all engineers of the country its earnest desire for the support of the whole engineering fraternity, and feels that the volumes which will be received by those who subscribe to the Congress will be a very adequate return for the subscription fee.

World Railway Congress Postponed.— On account of the European war, all preparations for the ninth session of the International Railway Congress which was to have been held in the German capitol next June, have been suspended.

The Congress, whose membership consists of governments and companies operating more than half the earth's railway mileage, is perhaps the most important railway association in the world. Its sessions are held every five years, the last having occurred at Berne, Switzerland, in 1910, and take up for discussion and interchange of ideas questions of railway maintenance, equipment and operation which are of importance to the railways of all countries.

At the next meeting the German government was to have acted as host and it was understood that Kaiser Wilhelm himself would open the convention. Many American railway officials had prepared papers embodying the newest methods and ideas prevailing on United States railways, overwhelmingly the world's greatest transportation system, in size almost seven times that of Germany, the nearest competitor. Among these, with their subjects of discussion, are the following:

H. U. Mudge, president, Rock Island Lines, Chicago, on roadbed and track and arrangements to be adopted in view of increasing weight of locomotives and speed of trains.

Epes Randolph, president, Southern Pacific Railroad of Mexico, Tucson, Ariz., on maintenance and supervision of track, and measures to provide economical organization in view of increasing traffic, speed, wages and cost of materials.

W. C. Cushing, chief engineer maintenance of way, Pennsylvania Lines, Pittsburgh, on special steels.

C. H. Cartlidge, bridge engineer, Burlington Route, Chicago, on reinforced concrete.

B. F. Bush, president, Missouri Pacific, St. Louis, on passenger cars and improvements and rules to be made to increase safety and comfort.

Horace G. Burt, chief engineer, Chicago Committee of Investigation of Electrification of Railway Terminals, Chicago, on electric traction in comparison with steam on lines of heavy traffic.

F. A. Delano, formerly president, Wabash and Monon Railways, Chicago, on passenger terminals and arrangements for reducing number of locomotive and empty car movements in terminal stations.

H. G. Kelly, vice-president, Grand Trunk, Montreal, on freight stations, organization to accelerate business and arrangements to simplify switching.

Fairfax Harrison, president, Southern Railway, Washington, D. C., on determination of cost of carrying passengers and freight, considering capital charges, and relation to rates.

Arthur Hale, general agent, American Railway Association, Chicago and New York, on interchange of freight cars and penalties for delay in returning cars.

A. F. Banks, president, Elgin, Joliet & Eastern, Chicago, on workmen's dwellings.

H. B. Spencer, vice-president, Southern Railway, Washington, on special methods of traction on narrow gauge roads.

Previous meetings of the Congress, with the number of government systems and private companies and mileage represented, have been held as follows:

		Govts.	Priv. Cos.	Mileage.
1885	Brussels	19	131	31,000
1887	Milan	26	165	33,391
1889	Paris	34	208	104,360
1892	Petrograd	47	262	128,600
1895	London	43	326	171,385
1900	Paris	48	338	208,534
1905	Washinton, D. C.	44	409	314,962
1910	Berne	48	420	359,057

Recent attendances have approached 1,000 delegates. The German government railways had prepared an elaborate program of entertainment for the visitors.

Pennsylvania Railroad's New Trainmen Congratulated by Management.—S. C. Long, general manager of the Pennsylvania Railroad, has sent the following personal letter to each of some eight hundred employes of different divisions of the railroad, who, during the strike of trainmen on the Monongahela Division in March, April and May of this year rendered such excellent service that the railroad was able to operate trains uninterruptedly, thereby preventing any inconvenience to the public:

"On March 20, 1914, practically the entire force of road and yard freight trainmen on the Monongahela Division, by their refusel to report for duty, when called, severed their relations with the Company.

"In order that the operations of the division might continue, it was necessary to fill the vacant positions with new men. This force had to be organized and the inexperienced men instructed in their duties. Food, sleeping quarters and police protection also had to be provided.

"To attain these results in the shortest possible time, it was necessary that the regular division operating force be supplemented by temporarily transferring to the Monongahela Division, officers and employes from other divisions of the Pennsylvania Lines East and West of Pittsburgh.

"The promptness with which operations were resumed and the success with which the business was handled were most gratifying to the management.

"The general superintendent of the Western Pennsylvania Division has called our attention to the commendable manner in which you participated in furthering this accomplishment.

"It is a pleasure, therefore, for me to join with the president and executive officers of our Company in expressing to you sincere appreciation of this practical display by you of that sense of responsibility to the public which every railroad man must share, as well as of your fidelity to the interest of this Company."

CONSTRUCTION.

A New Road for Pennsylvania.—A new railroad is to be constructed in Pennsylvania which it is expected will greatly reduce the rail distance between Pittsburgh and New York. The road, which is the New York, Pittsburgh and Chicago, will run through the central part of the State and has been approved by the Public Service Commission.

The New York, Pittsburgh and Chicago Railroad, with its available assets, was sold at Sheriff's sale on October 31st, and was bought in by Attorney Edward T. Noble, of the firm of Evans, Noble & Evans, who represent the reorganizers of the company. The Harriman estate owns the new company.

It is understood that the new line will run from Pittsburgh to Allentown. Half a million dollars has been spent in surveys and rights of way purchases The new line is surveyed to be 83.7 miles shorter between New York and

Route of the Proposed New York, Pittsburgh and Chicago Railway Across Pennsylvania.

Pittsburgh than any other line. Issuance of 17,000 shares of common stock at $50 par, or $850,000, has been authorized, although the new company, it is said at this time, desires to issue only $600,000 worth, and no provision is made for preferred stock.

The new air line will be built cheaper than a four-track road and can be made into a six-track highway. The grades will be better and a rich, new region in bituminous and anthracite coal and agricultural products will be opened. Connections at the Allentown terminus will be made with one of the Eastern trunk lines.

Canadian and American Engineers to Rebuild the Belgium Bridges.—The rehabilitation of hundreds of railroad bridges in Belgium and France which have been utterly destroyed as a result of the military operations was given as the object of a conference of representatives of the Canadian Pacific, Grand Trunk, Canadian Northern Railways and the Allan, C. P. R. and C. N. R. Steamship lines. The project under consideration is said to mean an outlay of millions of dollars in Canada and the United States and employment for thousands of men.

Those who took part in the conference were: J. L. Perron, solicitor of the C. P. R. and Montreal Tramways Company; William Lyall, of the P. Lyall Company; Timothy Foley, E. T. Foley and O. W. Swenson, of the large St. Paul firm of contractors who helped build the Grand Trunk Pacific; W. F. T. Tye, civil engineer of Montreal, who was engineer of the Ottawa Terminal Company; Patrick Dubec, a Montreal railroad man; C. W. Allan, of the Allan line of steamships; and one or two others.

It was explained that these gentlemen had met to consider the problem of restoring railway communication in Belgium and France. Despatches from the war zone have pointed out the enormous task facing European engineers of replacing bridges in the briefest period and bridge builders are of the opinion that this cannot be done quickly enough by rebuilding from the ground up. The procedure suggested is to transport whole sections of steel bridges from other sections of the country. All of the Canadian and American roads have on hand hundreds of "released" steel bridges, which, it is thought, could be made use of in the war zone.

Opening of the Magnolia Cut-Off of the Baltimore and Ohio.—The Magnolia Cut-Off of the Baltimore and Ohio Railroad, to which reference has been made in past issues of the "Railway World," was opened for traffic on December 6th.

This new double track line between Orleans Road and Little Cacapon, W. Va., is twelve miles long and cost about $6,000,000 to construct. It is one of the largest improvements of the kind ever undertaken, physical conditions and difficulties to overcome making the cost of $500,000 per mile exceptional in railroad construction. A notable feature in connection with its opening is that it was completed nineteen days ahead of the time fixed for its completion by the contract, the work having started eighteen months ago and built within the appropriation.

With the opening of this new line the Baltimore and Ohio Railroad checks off the last item in a budget of improvements commenced five years ago, when Daniel Willard became president of the road, to expand its facilities by providing third and fourth tracks across the Alleghenies, reducing grades, eliminating curves, building and enlarging yards and other facilities and purchasing new equipment, all at an approximate cost of $100,000,000.

The Magnolia cut-off is a part of a four-track system east of Cumberland, shortening the distance between Orleans Road and Little Cacapon by 5.8 miles as compared with the old line. It is almost an air line, first paralleling, then crossing overhead and being benched in the mountain above the old line; and eliminates a grade at Hansrote, W. Va., which required helper locomotives.

The Magnolia cut-off is a monument to the engineering genius of Francis Lee Stuart, who as chief engineer, planned and built this and many other improvements embraced in the Baltimore and Ohio program. Mr. Stuart was chief engineer of the Erie Railroad when that company constructed the now famous Bergen cut-off.

Primarily the cut-off is an essential factor in the economics of transportation, for not only will it save about six miles in distance but it will avoid a summit of the mountains for eastbound traffic and in this way effect an economy in the expense of train operation by doing away with the use of extra locomotives as helpers. The new line is almost straight like the crow flies between Orleans Road and Little Cacapon and eliminate 887 degrees of curvature compared with the original main line which was built along the winding banks of the Potomac River in the days before engineering problems were conquered by such heroic measures. There is practically no grade over the new line. At certain points on the improvement the four main tracks are side by side, while at other places the new line crosses overhead on concrete and steel bridges and passes under mountains through tunnels.

It is intended to operate the cut-off entirely for east-bound freight traffic, because of the economy possible and the further fact that the old line will avoid tunnels for passenger service.

GENERAL NEWS NOTES.

Holiday Greetings from the Denver and Rio Grande.—A holiday banner of a handsome holly and poinsettia design, extending season greetings to patrons of the Denver & Rio Grande and Western Pacific Railroads, has made its appearance in all freight and ticket offices, depot waiting rooms, general offices, dining cars and Pullman sleepers on this system. This method of bringing Christmas cheer to the traveler was first adopted by this road a year ago, and the innovation was received so kindly by the traveling public that it was repeated again this year.

New Emergency Internal Revenue Law as Applied to the Railways.—The provisions of the new emergency internal revenue law in so far as they apply to freight shipments provide that a one cent war revenue stamp be placed on each bill of lading, manifest, or similar memorandum. The shipper must affix this stamp to the bill-of-lading, and the railroads cannot accept and forward a shipment until this is done. Such is the ruling of the United States Treasury Department.

The department has also ruled that where freight is accepted at non-agency stations, it must be receipted for by the conductor accepting it. He must see to it that the stamp is attached to each of such receipts and cancelled as required by regulations before such shipment can be accepted. In the case of perishables or other instances where such receipts cannot be given by conductors, the goods may be accepted and transported in advance of the affixing of the stamp, but in that event the receipt must be delivered to the destination agent and he must require the stamp from the consignee.

To make it even plainer, the law provides that this stamp must be affixed before the railroads can accept a shipment; and in cases of perishables, they cannot deliver the shipment until the stamp is affixed on the receipt and cancelled. The law is penal, not civil. Its violation by any person or corporation is punishable in the Federal Courts.

The shipper or person is required to cancel the stamp, by writing across the face his initials and the date. Some shippers have been under the impression that, because the carriers have a limited supply of stamps on hand for the accommodation of their customers, the stamps were to be distributed by the roads free. This impression is erroneous. The law provides that the shipper pay for the stamp, affix and cancel it.

For the convenience of their customers, a number of roads have distributed a limited supply of stamps to their agents that they may be obtained from the latter, until the Government has completed its arrangements for distributing them through its own agencies. This, however, is simply as above stated, for the temporary convenience of the shipper, as these stamps will be sold at all post offices and it is expected that shippers will obtain their supplies there as the law requires that the revenue stamp for bills-of-lading must be provided by the shipper.

Aside from supplying the stamps, the burdens which fall upon the railroads to see that the law's mandates are carried out, are enormous as will be seen when it is stated that the Pennsylvania Lines East of Pittsburgh alone issue some 50,000 bills-of-lading and freight receipts every day.

PANAMA FAIR NOTES.

The Exhibit of the Union Pacific.—A colossal reproduction of Yellowstone National Park in "The Zone" at the Panama-Pacific International Exposition, by the Union Pacific System, will be a spectacular feature of the great fair.

The sum of $250,000 has been spent in reproducing upon an elaborate scale the glories of the great National Playground. Neither money nor effort was spared to make the reproduction worthy of the original. It was decided that the great scenic beauties of rocky crags and cliffs should not be mere haphazard combinations of wood framework and plaster and paint. Instead, forms were made over real rocks, which were first dipped in plaster of Paris and spread over the rocks, being fitted to every crack and crevice. This was allowed to dry and at the proper time an extra half inch of plaster was applied to the surface. When the whole was entirely dry, the mountain surfaces were raised to the desired position, the perfect outlines of the rocks being preserved. These pieces were placed in a range of mountains that rises high in the air and the whole painted and tinted in nature's colors. Shrubs, plants and moss are added.

Two hundred tons of plaster of Paris, 600,000 yards of burlap, eight tons of paint and 30 barrels of waterproofing were used in the construction of the mountain ranges. The cost of the labor for applying the plaster alone amounted to $25,000.

Entrance to Yellowstone concession is through a canyon with Eagle Nest Rock on one side and Golden Gate Viaduct on the other. A striking feature, after passing through the canyon portal, is the absolutely accurate reproduction in every feature of the Old Faithful Inn at Yellowstone Park. The statement applies not only to the architecture but to the exact size, although the banquet hall was necessarily made three times larger than the original and seats two thousand people.

In front of Old Faithful Inn is the largest relief map in the world, showing every feature of Yellowstone National Park on a measured scale. The map is 230 feet across and the relief shows every peak, river and geyser, the latter steaming and throwing up columns of water. The whole is encircled by a walk upon which visitors may view the map.

Through the mountains runs a trail more than one mile long, flanked with ferns and wild growth. Waterfalls, dropping from a great height, add to the beauties of the scene and great caves can be explored by the more venturesome sightseers.

Within the larger mountains is the Spectatorium, a vast theatre-like enclosure, in which will be shown other wonderful sights of Yellowstone National Park. Old Faithful Geyser, the most wonderful of all the natural phenomena of the Park, will be reproduced with life-like reality, throwing into the air a huge volume of boiling water and steam. This eruption will be repeated every 65 minutes (the same time of the original); eruptions by moonlight, at sunrise, at sunset, in a storm, or with clear sunshine, with all their varied effects, will be produced with hot water, steam and marvellous light devices.

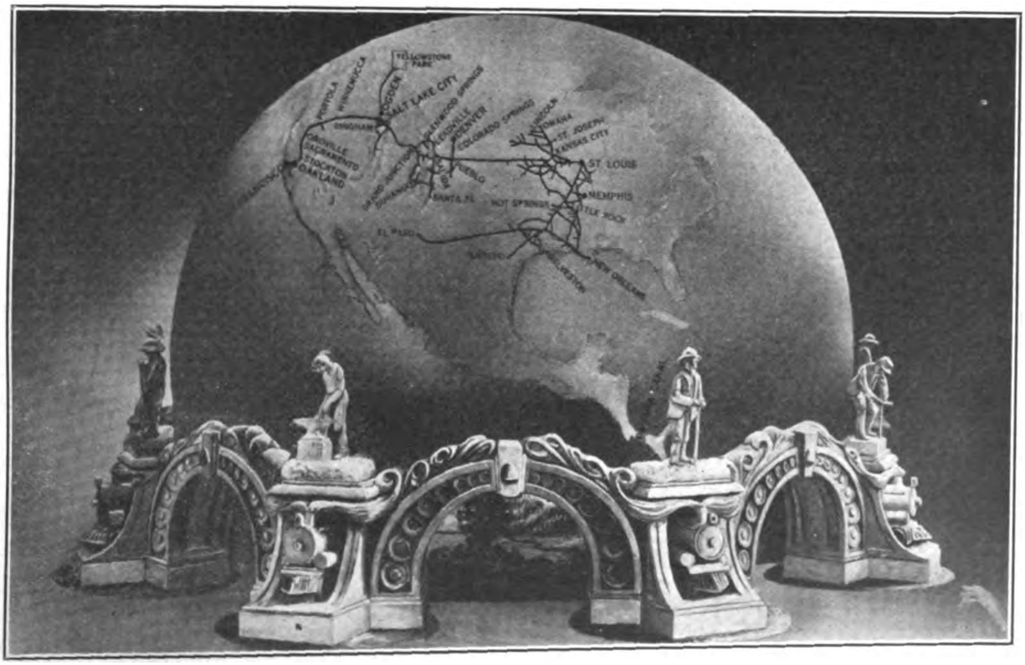
Another feature will be the Official Exposition Orchestra of eighty skilled musicians, under the leadership of a noted director. Concerts will be given in Old Faithful Inn every afternoon and evening.

The Denver and Rio Grande Exhibit at the Panama-Pacific International Exposition.— The first exhibitor in the railway section of the Palace of Transportation at the Panama-Pacific International Exposition, San Francisco, to complete the structure in which its exhibit will be placed is the Denver & Rio Grande System. An immense globe, 44 feet high and 51 feet in diameter, shows a map of North America, with the lines of this system traced from San Francisco to St. Louis. Inside, by means of models, the scenic marvels which have made the road famous are reproduced. The Black Canyon, the Royal Gorge, the Garden of the Gods, Pike's Peak and other of the great mountain peaks, waterfalls, springs, agricultural scenes, industries, and the cities which this system links together will all be faithfully reproduced in the globe and in an annex structure connected therewith. Night and day effects, sunrise and sunset, storms like those one may see collect at the rim and hurtle down a canyon which will be drenched with rain and emerge into gleaming sunshine all in the course of an hour's time, and other spectacular effects will be reproduced by electrical and other devices.

Southern Pacific Activities at the Panama-Pacific International Exposition.—Housed in an imposing two-story structure, seventy feet in height, and occupying in ground space an area almost equal to San Francisco's new million dollar auditorium, the Southern Pacific Company's main exhibit at the Panama-Pacific International Exposition promises to be one of the most attractive on the 1915 grounds. The location is ideal. The Southern Pacific building will be in the heart of the grounds, at the head of Palm Avenue. It will adjoin Machinery Hall and the Panama Canal exhibit, and be at one end of the concessions district.

The architecture of the building will be Renaissance. The front will be set off by a series of Corinthian columns and there will be six entrances, the three main ones being on Palm Avenue. The interior will include what is to be known as the "Sunset Theatre," where visitors will find an abundance of varied entertainment. This theatre will have a seating capacity of four hundred. The Central, or main exhibit room, 200 feet square, will be devoted to a unique and instructive exhibit pertaining to the Southern Pacific Company's business. While the specific nature of this exhibit has not been revealed, the promise is made that it will prove an exceptionally interesting and instructive one both to the Pacific coast resident and to the visitor who comes out here from other climes. Between the entrances and the exhibit sections, there will be spacious and highly decorative lobbies.

The company has stipulated with the exposition people to reserve between thirteen and fourteen



THE NOVEL EXHIBIT OF THE DENVER AND RIO GRANDE AT THE PANAMA-PACIFIC INTERNATIONAL EXPOSITION.

thousand feet of space in one wing of the structure for such space as may be desired by other transportation companies, rail or steamer, and offices of this kind will be confined to this building. The convenience to exposition visitors of concentrating the transportation offices in this manner is obvious.

BOOK REVIEWS.

Statistical Atlas: 1914.—The Census Bureau at Washington has issued a statement to the effect that the Statistical Atlas of the United States soon will be ready for distribution. It is issued by William J. Harris, Director of the Bureau of the Census of the Department of Commerce. The Atlas is compiled primarily as a popular volume and will also prove of great value to educators and statisticians. The statistics of the Census Bureau are presented in a graphic manner, which renders them easy of comprehension and well adapted for use for lectures and technical studies of the various subjects presented in the census reports. As the edition is limited, these volumes can not be as freely distributed as other census publications.

The Atlas contains 99 pages of descriptive text and 503 pages comprising 698 maps and 278 diagrams, and includes comparative figures for many of the censuses from 1790 to 1910. The illustrations cover the subjects of population, agriculture, manufactures, mines and quarries, cotton, financial statistics of cities, vital statistics, religious bodies, marriage and divorce, and insane in hospitals. The text includes a short description of each of the maps and diagrams.

New Percentage Maps Published by Western Firm.—Wymond and Clark of Chicago, have recently published two new percentage maps showing east and west bound percentage groups in Central Freight Association contiguous territory. The price of these maps range from $5.00 to $10.00 according to style of mounting and binding.

The percentage groups are based on the New York-Chicago rate, the maps showing by percentages of this base rate the rates between C. F. A. and Eastern territories. An appendix accompanying the maps, gives the rules for the construction of the rates and tables to facilitate their computation.

The information contained in the maps and appendix is indispensable to a clear understanding of these rates, as they show not only the absolute rates between the territories named but the ADJUSTMENT of all points—a comprehensive view of the rates from any group as related to all other groups.

The rates between these territories are on the Percentage and Differential Basis and the maps illustrate in a very striking way the advantages of that system of rate making. As the percentages remain the same whatever the base rate may be, the value of the maps will not be affected by any change in base rate.

We are informed by the publishers, that the maps have come into general use in the associations of the railroads in the territories covered.

RESIGNATIONS.

Executive.

O. L. Dickeson, president, White Pass and Yukon Railroad.

Ivy L. Lee, executive assistant to President Rea, Pennsylvania Railroad.

E. W. McKenna, vice-president, Chicago, Milwaukee and St. Paul Railroad.

David McNicoll, vice-president, Canadian Pacific Railway.

Samuel C. Scotton, director, Chicago, Burlington and Quincy Railroad.

Benjamin Strong, Jr., director, Seaboard Air Line.

Frank A. Vanderlip, director, Seaboard Air Line.

P. A. B. Widener, director, Reading Company, the Philadelphia & Reading Railway and the Reading Coal & Iron Company.

Engineering and Mechanical.

J. W. Fogg, master mechanic, Baltimore and Ohio Railroad, Chicago Terminal Railroad.

F. J. Glover, electrical engineer, Rock Island Lines.

B. F. Harrison, roadmaster, Southern Division, Chicago, Rock Island and Gulf Railway.

A. G. Kantman, superintendent of machinery, Nashville, Chattanooga and St. Louis Railroad.

F. D. Nauman, division engineer, Chicago Division, Baltimore and Ohio Railroad.

J. H. Ruxton, master mechanic, San Antonio, Uvalde & Gulf Railroad.

Operation.

Roldin A. Brown, trainmaster, Illinois Central Railroad.

J. B. Paul, superintendent, Liberty-White Railroad.

Traffic.

W. R. Alberger, traffic manager, Tonopah and Tidewater Railroad.

S. J. Alexander, agent, Union Lines of the Pennsylvania Lines West of Pittsburgh and the Pennsylvania Railroad at Sioux City, Ia.

W. H. Clancy, city passenger and ticket agent, Grand Trunk Railroad.

H. C. Davis, general agent, Lehigh Valley Railroad.

H. L. Miller, general freight agent, Southern Railway.

T. F. Powell, division freight agent, Erie Railroad.

N. H. Reed, assistant general advertising agent, Atchison, Topeka and Santa Fe Ry.

A. C. Stutsman, district passenger agent, Cincinnati Northern Railroad.

William B. Wheeler, general western passenger agent, Lehigh Valley Railroad.

Miscellaneous.

Ross D. Synder, chief examiner, Interstate Commerce Commission.

W. F. Woerner, member, Missouri Public Service Commission.

ELECTIONS AND APPOINTMENTS.

Executive.

F. J. Bannister, vice-president, Shreveport, Alexandria and Southwestern Railway. Headquarters, Kansas City, Mo.

W. M. Baugh, assistant to receiver, Liberty-White Railroad. Headquarters, McComb, Miss.

E. W. Beatty, vice-president, Canadian Pacific Railway. Headquarters, Montreal, Que.

C. H. Buell, staff registrar, Canadian Pacific Railway. Headquarters, Montreal, Que.

George Bury, vice-president, Canadian Pacific Railroad. Headquarters, Montreal, Que.

F. M. B. Close, director, Seaboard Air Line Railroad.

M. T. Cogley, president, Texas Mexican Railway. Headquarters, Mexico City, Mexico.

John A. Cushing, vice-president, Mt. Tamalpais & Muir Woods Railway. Headquarters, Mill Valley, Cal.

J. E. Dalrymple, V. P. in charge of traffic, Montreal and Southern Counties Railroad.

R. S. Davis, second vice-president and general manager in charge of operation and traffic, Shreveport, Alexandria and Southwestern Railway. Headquarters, Kansas City, Mo.

Lyman Delano, third vice-president, Atlantic Coast Line Railroad. Headquarters, Wilmington, N. C.

E. Dickinson, director, Kansas City, Mexico & Orient Railroad

F. C. Elliot, president, White Pass and Yukon Route. Headquarters, Chicago, Ill.

Fairfax Harrison, president, American Highway Association.

W. R. Hudson, president of the Cincinnati Railroad Club.

O'Donnell Iselin, director, Buffalo, Rochester and Pittsburgh Railway.

Louis C. Krauthoff, director, Chicago & Alton Railroad.

R. A. Long, president, Shreveport, Alexandria and Southwestern Railway. Headquarters, Kansas City, Mo.

Samuel F. Manning, president, American Association of Traveling Passenger Agents.

Harry L. Miller, president, Interstate Railroad. Headquarters, Big Stone Gap, Virginia.

L. W. Page, vice-president, American Highway Association.

T. R. Ryan, sub and acting managing director, Brazil Railways and general superintendent, Sorocobana Railway Company. Headquarters, Sau Paulo, Brazil.

W. C. Savage, president, Mt. Tamalpais and Muir Woods Railway. Headquarters, Mill Valley, Cal.

Frederick C. Syze, president, New York Railroad Club.

J. D. Tennant, third vice-president, Shreveport, Alexandria and Southwestern Railway. Headquarters, Kansas City, Mo.

George S. Waid, vice-president and general manager, Sunset Central Lines of the Southern Pacific Company. Headquarters, Houston, Tex.

Roberts Walker, director, Chicago and Alton Railroad.

George W. Watts, director, Seaboard Air Line Railroad.

Joseph E. Widener, director, Philadelphia & Reading Railway and the Reading Coal & Iron Company.

Legal.

Frank Smith, attorney for the Interstate Commerce Commission in Illinois.

W. R. Thurmond, general counsel, Shreveport, Alexandria and Southwestern Railway System. Headquarters, Kansas City, Mo.

Financial.

R. T. Demsey, secretary, Shreveport, Alexandria and Southwestern Railway System. Headquarters, Kansas City, Mo.

Elliott T. Monnett, secretary-treasurer, American Association of Traveling Passenger Agents.

Accounting.

A. S. Dutton, auditor of freight accounts, Toronto, Hamilton and Buffalo Railway. Headquarters, Detroit, Mich.

A. Mackrille, general auditor, New York, New Haven & Hartford Railroad. Headquarters, New Haven, Conn.

T. M. Prentice, auditor, New York, New Haven & Hartford Railroad. Headquarters, New Haven, Conn.

P. C. Rickey, general auditor, Shreveport, Alexandria and Southwestern Railway System. Headquarters, Kansas City, Mo.

Engineering and Mechanical.

Milo M. Backus, roadmaster, Springfield Division, Illinois Central Railroad. Headquarters, Clinton, Ill.

Lewis H. Bond, roadmaster, St. Louis Division, Illinois Central Railroad. Headquarters, Carbondale, Ill.

John O. Boyer, road foreman of engines, Reading Division, Philadelphia and Reading Railway. Headquarters, St. Clair, Pa.

M. F. Clements, engineer in charge of track elevation, Northern Pacific. Headquarters, Spokane, Wash.

W. Gillespie, mechanical superintendent, Central Vermont Railroad. Headquarters, St. Albans, Vt.

John B. Glasgow, trainmaster, Northern Pacific Railway. Headquarters, Mandan, N. D.

S. E. Hutton, engineer, Public Utilities Commission of Idaho.

E. J. Langhurst, road foreman of engines, Baltimore and Ohio Railroad. Headquarters, Parkersburg, W. Va.

E. H. McCann, master mechanic, San Antonio, Uvalde and Gulf Railroad. Headquarters, Pleasanton, Texas.

F. K. Moses, master mechanic, Baltimore and Ohio, Chicago Terminal Railroad. Headquarters, East Chicago, Ill.

Louie F. Newton, trainmaster, Northern Pacific Railway. Headquarters, Helena, Mont.

H. C. Oviatt, assistant mechanical superintendent, New York, New Haven & Hartford Railroad. Headquarters, New Haven, Conn.

G. W. Ristine, assistant road foreman of engines, Baltimore and Ohio Railroad. Headquarters, Cleveland, Ohio.

Richard Sachse, chief engineer, California Railroad Commission in San Francisco.

John Scheifele, road foreman of engines, Philadelphia and Reading Railway. Headquarters, Reading, Pa.

Irwin A. Seiders, fuel inspector, Philadelphia & Reading Railway.

J. Shiver, assistant road foreman of engines, Baltimore and Ohio Railroad, New Castle Division.

H. F. Staley, master mechanic, Boyne City, Gaylord and Alpena Railroad. Headquarters, Boyne City, Mich.

A. Sturrock, district master mechanic, Canadian Pacific. Headquarters, Nelson, B. C.

Charles B. Teller, roadmaster, Southern Division, Chicago, Rock Island and Gulf Railway. Headquarters, Fort Worth, Texas.

E. Wanamaker, electrical engineer, Rock Island Lines. Headquarters, Chicago, Ill.

W. F. Weigman, general foreman, car department, Charleston and Western Carolina Railway. Headquarters, Augusta, Ga.

W. H. Wortman, general foreman, Canadian Pacific Railway. Headquarters, Calgary, Alta.

Operation.

P. R. Albright, assistant general manager, Atlantic Coast Line Railroad. Headquarters, Wilmington, N. C.

H. Buckingham, general manager, Mt. Tamalpais & Muir Woods Railway. Headquarters, Mill Valley, Cal.

S. W. DeWolf, general manager, Texas-Mexican Railway. Headquarters, Laredo, Texas.

E. O. Dunn, chief despatcher, 27th and 28th districts, Grand Trunk Railway. Headquarters, Durand, Mich.

J. S. Gillespie, acting general superintendent, Columbus and Southern Railway. Headquarters, Laurelville, Ohio.

R. C. Hobbs, general manager, Kansas City & Memphis Railway. Headquarters, Rogers, Ark.

M. C. Hughes, assistant superintendent, Beardstown Division, Chicago, Burlington and Quincy Railroad. Headquarters, Centralia, Ill.

Charles H. Hurdleston, manager, Texas State Railroad. Headquarters, Rusk, Texas.

O. S. Jackson, general superintendent, Chicago, Terre Haute and Southeastern Railroad.

E. P. Laird, superintendent, Richmond District, Atlantic Coast Line. Headquarters, Richmond, Va.

R. F. Ledford, assistant superintendent, Chicago, Burlington and Quincy Railroad. Headquarters, St. Joseph, Ill.

M. Lipman, supervisor, section 18, Conemaugh Division, Pennsylvania Railroad.

R. B. Mann, superintendent of terminals, Cincinnati, Hamilton and Dayton Railway. Headquarters, Cincinnati, Ohio.

L. L. Marshall, superintendent, Lake Erie, Franklin & Clarion Railroad. Headquarters, Clarion, Pa.

J. H. Nelson, superintendent, Paducah-Memphis Division, Nashville, Chattanooga and St. Louis Railway. Headquarters, Memphis, Tenn.

W. J. Nixon, trainmaster, Fourth District, Grand Trunk Railway. Headquarters, Montreal, Que.

N. P. North, trainmaster, Grand Trunk Railway. Headquarters, Durand, Mich.

Fred B. Oren, trainmaster, Peoria and Mattoon Districts, Illinois Central. Headquarters, Mattoon, Ill.

R. H. Orwig, supervisor of section 10½, Pittsburgh Division, Pennsylvania Railroad.

S. L. Racey, assistant superintendent, First Division, Denver and Rio Grande Railroad. Headquarters, Pueblo, Colo.

W. L. Schneider, inspector of transportation, Delaware and Hudson Company. Headquarters, New York.

Air Brake Education

No. 4. Who Should Study the Air Brake?

THE Westinghouse idea is that every railroad man should study the Air Brake.

The natural classification of any railroad organization, with reference to the Air Brake Education required, might be stated broadly as follows:

(a) Those who actually operate the air brake to control moving trains. The operating crews including engineers, firemen, brakemen, conductors, etc., are numerically, the largest class primarily interested in, and responsible for, skillful brake manipulation and train handling.

(b) Those who maintain, repair and test the air brake. Air brake foremen, repairmen, test rack operators, inspectors, etc. This class is small compared with trainmen and is primarily interested in the structural features and detailed operation of the individual devices.

(c) Those who lay out and make the installation. Mechanical engineers, chief draftsmen, car designers, car and locomotive builders, railroad inspectors, etc. These men are concerned most with matters of braking power, leverage, distribution of apparatus on the car or locomotive in relation to other devices, and similar work.

(d) Those in authority who supervise and instruct. Supervisors of air brakes, air brake instructors, road foremen of engines, etc. These officials should have a comprehensive knowledge of both the practical manipulation and the mechanical operation of the air brake system, its individual parts, and the principles upon which this operation is based.

(e) Those in executive capacity who are responsible for the most efficient and profitable management of the road. These officials, including boards of directors, should have a broad appreciation of the possibilities and performance of the air brake, and are vitally interested in the use of the best type of brake for a given service, establishing common standards, and encouraging every phase of air brake education.

This is the fourth of a series of papers covering a practical review of the essential elements of Air Brake Education.

Who believes the Blaisdell Pencil is best?

Pennsylvania Railroad
Standard Oil Company
United States Steel Corporation
United States Navy
Ford Motor Car Company

Just to mention a few of the huge concerns using pencils by the 100,000 who have adopted Blaisdells either in whole or in part. Many of the largest corporations use Blaisdells *exclusively*. If they have found the Blaisdell to be the best pencil, how can you hope to find a better one?

We make special railroad pencils

A full line for every railroad purpose, including the following Blaisdell makes:

"Standard Equipment" pencils of superfine quality; 9 grades; also indelible and 8 colors for checking.

"Semaphore" pencils with extra quality leads; 5 grades.

"R-R-S" pencils with quality leads; 4 grades, and in 4 colors.

"Right-O'-Way" low priced pencils with good leads; 3 grades, and 3 colors.

"Wildcat" lower priced pencils where fine quality of lead is not essential; No. 2 grade only.

Samples of any or all pencils of our "Railroad Series" are yours for the asking.

Freight Rates
STUDIES IN RATE CONSTRUCTION
By John P. Curran.
(Of the Central Freight Association.)

Years of Experience Boiled down in 367 pp.

This new book, the first of its kind ever published, tells why the rates are in the tariffs and how to find and use them. It explains the GROUP RELATION THEORY, THE DIFFERENTIAL BASIS, THE BASING POINT SYSTEM, THE MILEAGE SCALE, ETC. It is illustrated by current rate applications.

HOW ARE FREIGHT RATES MADE?

The answer to this question, answers also how markets are made.

"I have been in the rate game for thirty years but I never learned half of the rate-bases plainly explained in that book," said a prominent rate-man recently.

This new work is endorsed by leading traffic experts throughout the United States and Canada. ORDER YOUR COPY TO-DAY.

LIMITED EDITION—$5 POSTPAID.
10% discount when remittance accompanies the order.
Size—6x9, 367 pages, silk cloth binding.

Postal Life N.Y.

The Postal Life Insurance Company pays *you* the Commissions that other Companies pay their agents

THE POSTAL LIFE is the only Company that opens its doors to the public so that those desiring sound insurance-protection at low cost can deal **directly** for it, either **personally** or **by correspondence.**

Whether you call or write, you make a **guaranteed** saving corresponding to the agent's commission the **first year,** less a moderate advertising charge. Your first year **Commission Dividend** ranges up to

40% *of the Premium on Whole-Life Policies*

In **subsequent** years you get the **Renewal Commission** other companies pay their agents, namely 7½%, and you also receive an Office-Expense Saving of 2%, making up the

Annual Dividend of **9½%** *Guaranteed in the Policy*

And after the first year the POSTAL pays **contingent dividends besides,** depending on earnings as in the case of other companies.

Such is the POSTAL way; it is open to **you.** Call at the Company's offices, if convenient, or **write now** and find out the exact sum it will pay **you** at **your** age—the **first year** and **every other.**

POSTAL LIFE INSURANCE COMPANY
WM. R. MALONE, President
35 Nassau Street, New York

STRONG POSTAL POINTS

First: *Standard policy-reserves,* now nearly $10,000,000. *Insurance in force nearly* $50,000,000.

Second: *Old-line legal reserve insurance*—not fraternal or assessment.

Third: *Standard policy-provisions,* approved by the State Insurance Department.

Fourth: Operates under *strict State requirements* and subject to the United States postal authorities.

Fifth: *High medical standards* in the selection of risks.

Sixth: *Policyholders' Health Bureau* provides one free medical examination each year, if desired.

POSTAL LIFE BUILDING
35 Nassau Street, New York

See How Easy It Is

In writing simply say: *Mail me insurance-particulars for my age as per*
RAILWAY WORLD
In your letter be sure to give

1. *Your Full Name.*
2. *Your Occupation.*
3. *The Exact Date of your Birth.*

No agent will be sent to visit you: the Postal Life employs no agents.

Assets: nearly $10,000,000

Insurance in force nearly: $50,000,000
